Subject: Contact change – Size 23

ITT has made a change in the style of contact used for MKJ crimp socket contact. We believe that this change will bring more value to our customers. The contact with the integrated hood/contact clip will be the standard and be provided with all current and future orders. The contact previously used with a stainless steel (SS) hood will still be available for both purchase and on connectors, but will need to be specified on the order using the ITT modification code 'F256'. The contacts are fully interchangeable and there is no change in the crimp location. Both contacts meet the rigorous performance requirements needed for today's harsh environments. The stainless steel hood design may be substituted for any/all connectors as inventory is depleted. Typical examples are shown below as well as a picture showing the different contacts for reference. Please contact your local ITT Sales Representative with any questions.

Part number Examples:

MKJ1A6T10-26SA: Connector provided with Integrated Hood contact (may substitute SS hood)

MKJ1A6T1026SA F256: Connector provided with SS Hood (No substitutions)

ITT P/N 031-9750-000: Integrated Hood W/Contact Clip

ITT P/N 031-9750-040: SS Hooded contact
