

TPS2663x 60-V, 6-A Power Limiting, Surge Protection Industrial eFuse

1 Features

- 4.5-V to 60-V operating voltage, 67-V absolute maximum
- Integrated 60-V, 31-mΩ R_{ON} hot-swap FET
- Reverse polarity protection and reverse current blocking support with an external N-channel FET
- 0.6-A to 6-A adjustable current limit ($\pm 7\%$)
- Electrical fast transients (IEC61000-4-4) immunity and load protection during surge (IEC 61000-4-5) with Class-A system performance
- Fast reverse current blocking (0.17 μ s)
- Variants with adjustable output power limiting ($\pm 6\%$)
- Adjustable UVLO, OVP Cut Off, output slew rate control for inrush current limiting
- Charges large and unknown capacitive loads through thermal regulation during device power up
- Variants with 35-V and 39-V maximum over voltage clamp
- Power Good Output (PGOOD)
- Selectable over current fault response options between auto-retry and latch off (MODE)
- Variants with 2x pulse over current support
- Analog current monitor (IMON) output ($\pm 6\%$)
- UL 2367 recognized
 - File No. E169910
 - RILIM ≥ 3 kΩ
- IEC 62368-1 certified

2 Applications

- Factory automation and control – PLC, DCS, HMI, I/O modules, sensor hubs
- Motor drives – CNC, encoder supply
- Electronic circuit breakers

3 Description

The TPS2663x devices are easy to use, positive 60 V and 6-A eFuse with a 31-mΩ integrated FET. It features a B-FET driver to control an external N-channel FET in the system designs that require protection from input reverse polarity faults and reverse current blocking. The device incorporates robust protection features that simplify system designs requiring protection during system tests like IEC61000-4-5 industrial surge tests. The device features an adjustable output power limiting (PLIM) functionality that simplifies the system design requiring compliance in accordance to the standards like IEC61010-1 and UL1310. Additional protection features include adjustable overcurrent protection, fast short circuit protection, output slew rate control, overvoltage protection and undervoltage lockout.

For system status monitoring and downstream load control, the device provides fault and a precise current monitor output. PGOOD can be used for enable and disable control of the downstream DC-DC converters. The MODE pin allows flexibility to configure the device between the two current-limiting fault responses (latch off and auto-retry).

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPS26630 TPS26631 TPS26632 TPS26633 TPS26635	VQFN (24)	4.00 mm × 4.00 mm
TPS26631 TPS26633 TPS26636	HTSSOP (20)	6.50 mm × 4.40 mm

- (1) For all available packages, see the orderable addendum at the end of the data sheet.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision E (March 2020) to Revision F (June 2021)	Page
• Updated the numbering format for tables, figures and cross-references throughout the document	1
Changes from Revision D (August 2019) to Revision E (March 2020)	Page
• Changed UL 2367 from Recognition pending to Recognized	1
• Added IEC 62368-1 Certified to the <i>Features</i> section.....	1
Changes from Revision C (March 2019) to Revision D (August 2019)	Page
• Replace the TPS26632 device with the TPS26636 device in the <i>Device Information</i> table.....	1
• Added the TPS26636 device to the <i>Pin Configuration and Functions</i> table.....	3
• Added the TPS26636 device to the <i>Pin Functions</i> table.....	3
• Updated the Input Voltage in the <i>Absolute Maximum Ratings</i> table.....	6
• Updated the PLIM Input and Output Ramp Control in the <i>Electrical Characteristics</i> table.....	7
Changes from Revision B (January 2019) to Revision C (March 2019)	Page
• Changed from Advance Information to Production Data	1
Changes from Revision A (December 2018) to Revision B (January 2019)	Page
• Updated the <i>Pin Configuration and Functions</i> section	3
• Updated <i>Layout Example</i>	40
Changes from Revision * (September 2018) to Revision A (December 2018)	Page
• Updated the <i>Pin Configuration and Functions</i> section.....	3
• Updated <i>Functional Block Diagram</i>	17
• Updated <i>Layout Example</i>	40

5 Device Comparison Table

PART NUMBER	OVERVOLTAGE PROTECTION	OVERLOAD FAULT RESPONSE	ADJUSTABLE OUTPUT POWER LIMITING
TPS26630	Overvoltage cut-off, adjustable	Active Current Limiting (1x)	No
TPS26631	Overvoltage cut-off, adjustable	Active Current Limiting with Pulse current support (2x)	No
TPS26632	Overvoltage clamp, fixed (35-V max)	Active Current Limiting (1x)	Yes
TPS26633	Overvoltage clamp, fixed (35-V max)	Active Current Limiting with Pulse current support (2x)	Yes
TPS26635	Overvoltage clamp, fixed (39-V max)	Active Current Limiting with Pulse current support (2x)	Yes
TPS26636	Overvoltage clamp, fixed (35-V max)	Active Current Limiting with Pulse current support (2x)	Yes

Figure 6-4. TPS26633, TPS26636 PWP Package 20-Pin HTSSOP Top View

Table 6-1. Pin Configuration and Functions

PIN			TYPE	DESCRIPTION
NAME	TPS26630, TPS26631, TPS26632, TPS26633, TPS26635, TPS26636			
	VQFN	HTSSOP		
IN	1	1	P	Power input. Connects to the DRAIN of the internal FET
	2	2		
	—	3		
B_GATE	3	4	O	Blocking FET gate driver output. Connect B_GATE to GATE of the external NFET. If external FET is not used then leave B_GATE pin floating. See the Input Reverse Polarity Protection (B_GATE, DRV) section.
DRV	4	5	O	Blocking FET fast pull down switch drive. Connect DRV to the GATE of external pull down switch. Leave this pin floating if external N-FET is not used.
IN_SYS	5	6	P	Power input and supply voltage of the device. When an external Blocking FET is used then connect IN_SYS to source of the FET. Short IN_SYS to IN in case blocking FET is not used.
UVLO	6	7	I	Input for setting the programmable undervoltage lockout threshold. An undervoltage event turns off the internal FET and asserts FLT to indicate the power-failure. Connect UVLO pin to GND pin to select the internal default threshold.
OVP	7	8	I	Input for setting the programmable overvoltage protection threshold (For TPS26630 and TPS26631 Only). An overvoltage event turns off the internal FET and asserts FLT to indicate the overvoltage fault. Connect OVP pin to GND pin externally to select the internal default threshold.
PLIM	7	8	I	Input for setting the programmable output power limiting threshold (For TPS26632, TPS26633, TPS26635 and TPS26636 Only). Connect a resistor across PLIM to GND to set the output power limit. Connect PLIM to GND if PLIM feature is not used. See the tput power limit. Connect PLIM to GND if PLIM feature is not used. See the Output Power Limiting, PLIM (TPS26632, TPS26633, TPS26635 and TPS26636 Only) section.
GND	8	9	—	Connect GND to system ground
dVdT	9	10	I/O	A capacitor from this pin to GND sets output voltage slew rate. See the Hot Plug-In and In-Rush Current Control section.
ILIM	10	11	I/O	A resistor from this pin to GND sets the overload and short-circuit current limit. See the Overload and Short Circuit Protection section.
MODE	11	12	I	Mode selection pin for overload fault response. See the Device Functional Modes section.
SHDN	12	13	I	Shutdown pin. Pulling SHDN low makes the device to enter into low power shutdown mode. Cycling SHDN pin voltage resets the device that has latched off due to a fault condition.
IMON	13	14	O	Analog current monitor output. This pin sources a scaled down ratio of current through the internal FET. A resistor from this pin to GND converts current to proportional voltage. If unused, leave it floating.
FLT	14	15	O	Fault event indicator. It is an open drain output. If unused, leave floating or connect to GND.
PGTH	15	16	I	PGOOD comparator input.
PGOOD	16	17	O	Active High. A high indicates PGTH has crossed the V _(PGTHR) threshold and the internal FET is enhanced. PGOOD goes low when V _(PGTH) hits V _(PGTHF) threshold. If PGOOD is unused then connect to GND or leave it floating.
OUT	17	18	P	Power output of the device
	18	19		
	—	20		

Table 6-1. Pin Configuration and Functions (continued)

PIN			TYPE	DESCRIPTION
NAME	TPS26630, TPS26631, TPS26632, TPS26633, TPS26635, TPS26636			
	VQFN	HTSSOP		
N. C	19	—	—	No Connect
	20			
	21			
	22			
	23			
	24			
PowerPad™	—	—	—	Connect PowerPad to GND plane for heat sinking. Do not use PowerPad as the only electrical connection to GND.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
IN_SYS	Input Voltage	–60	67	V
IN_SYS (10ms transient), T _A = 25 °C		–60	75	V
IN, OUT, UVLO, $\overline{\text{FLT}}$, PGOOD, PGTH		–0.3	67	V
IN_SYS – OUT (10ms transient), with a Blocking FET		–85		V
IN (10ms transient), T _A = 25 °C		–0.3	75	V
BGATE		–60	81	V
BGATE – IN_SYS		–0.3	14	V
DRV		–60	72	V
DRV – IN_SYS		–0.3	20	V
OVP, dVdT, IMON, MODE, $\overline{\text{SHDN}}$, ILIM, PLIM		–0.3	5.5	V
I _{FLT} , I _{dVdT} , I _{PGOOD}	Sink current		10	mA
I _{dVdT} , I _{ILIM} , I _{PLIM} , I _{MODE} , I _{SHDN}	Source current	Internally limited		
T _J	Operating Junction temperature	–40	150	°C
	Transient junction temperature	–65	T _(TSD)	
T _{stg}	Storage temperature	–65	150	

- (1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
IN_SYS, IN	Input Voltage	4.5		60	V
OUT, UVLO, PGTH, PGOOD, $\overline{\text{FLT}}$		0		60	
OVP, dVdT, IMON, MODE		0		4	
$\overline{\text{SHDN}}$		0		5	
ILIM	Resistance	3		30	kΩ
IMON	Resistance	1			
PLIM	Resistance	60.4		150	
IN, IN_SYS, OUT	External Capacitance	0.1			μF
dVdT		10			nF
T _J	Operating Junction temperature	–40	25	125	°C

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TPS2663		UNIT
		RGE (VSON)	PWP (HTSSOP)	
		24 PINS	20 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	31.4	32.2	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	23.2	23.4	°C/W
R _{θJB}	Junction-to-board thermal resistance	10.2	10	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	0.3	0.3	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	10.2	9.9	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	2.8	3.6	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

7.5 Electrical Characteristics

–40°C ≤ T_A = T_J ≤ +125°C, 4.5 V < V_(IN_SYS) = V_(IN) < 60 V, V_(SHDN) = 2 V, R_(ILIM) = 30 kΩ, IMON = PGOOD = FLT = OPEN, C_(OUT) = 1 μF, C_(dVdT) = OPEN. (All voltages referenced to GND, (unless otherwise noted))

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
SUPPLY VOLTAGE

9 Detailed Description

9.1 Overview

The TPS2663x devices are a family of 60-V industrial eFuses. The devices provides robust protection for all systems and applications powered from 4.5 V to 60 V. With an external N-channel FET the devices can be used to protect the loads from negative supply voltages down to –60 V. For hot-pluggable boards, the devices provides hot-swap power management with in-rush current control and programmable output voltage slew rate features using the dVdT pin. Load, source and device protections are provided with many programmable features including overcurrent, overvoltage and undervoltage. The precision overcurrent limit ($\pm 7\%$ at 6 A) helps to minimize over design of the input power supply, while the fast response short circuit protection 1- μs (typical) immediately isolates the faulty load from the input supply when a short circuit is detected. The device features fast reverse current blocking response (0.17 μs). The internal robust protection control blocks of the TPS2663x along with its $\pm 60\text{-V}$ rating, helps to simplify the system designs for the industrial surge compliance ensuring complete protection of the load and the device. The 60-V maximum DC operating and 70-V absolute maximum voltage rating enables system protection from 60-V DC input supply faults and from industrial SELV power supplies.

By monitoring the output (Load) voltage through the PGTH pin, the device distinguishes between real system faults and system transients and the turn ON delay during a fault recovery is controlled accordingly. The valid load voltage detection threshold can be adjusted using a resistor ladder network from OUT, PGTH and GND. This scheme ensures fast recovery during system tests like voltage interruption and brown-out tests, EMC testing like Electrical Fast Transients (IEC61000-4-4) and Surge (IEC61000-4-5).

The TPS26632, TPS26633, TPS26635 and TPS26636 devices integrate adjustable output power limiting (PLIM) functionality that simplifies the system design requiring compliance in accordance to standards like IEC61010-1 and UL1310.

The devices provides precise monitoring of voltage bus for brown-out, overvoltage conditions and asserts fault signal for the downstream system. Its overall threshold accuracy of 2% ensures tight supervision of bus, eliminating the need for a separate supply voltage supervisor chip. The devices monitors $V_{(\text{IN_SYS})}$ and $V_{(\text{OUT})}$ to provide true reverse current blocking when a reverse condition or input power failure condition is detected.

Additional features of the TPS2663x devices include:

- $\pm 6\%$ Current monitor output (IMON) for health monitoring of the system
- A choice of latch off or automatic restart mode response during current limit, power Limit and thermal fault using MODE pin
- PGOOD indicator output with $\pm 2\%$ accurate adjustable valid load voltage detection threshold (PGTH)
- Over temperature protection to safely shutdown in the event of an overcurrent event
- De-glitched fault reporting for supply brown-out and overvoltage faults
- Enable and disable control from an MCU using $\overline{\text{SHDN}}$ pin

9.2 Functional Block Diagram

9.3 Feature Description

9.3.1 Hot Plug-In and In-Rush Current Control

The devices are designed to control the inrush current upon insertion of a card into a live backplane or other "hot" power source. This limits the voltage sag on the backplane's supply voltage and prevents unintended resets of the system power. The controlled start-up also helps to eliminate conductive and radiative interferences. An external capacitor connected from the dVdT pin to GND defines the slew rate of the output voltage at power-on. The fastest output slew rate of 24 V/500 μ s can be achieved by leaving dVdT pin floating. The inrush current can be calculated using Equation 1.

$$I = C \times \frac{dV}{dT} \geq I_{(INRUSH)} = C_{(OUT)} \times \frac{V_{(IN)}}{t_{dVdT}} \quad (1)$$

where

$$t_{dVdT} = 20.8 \times 10^3 \times V_{(IN)} \times C_{(dVdT)} \quad (2)$$

Figure 8-1 illustrates in-rush current control performance of the device during Hot Plug-In.

Figure 9-2. Thermal Regulation Loop Response During Power Up with Large Capacitive Load

9.3.2 PGOOD and PGTH

The devices feature an open drain Power good (PGOOD) indicator output. PGOOD can be used for enable and disable of the downstream loads like DC-DC converters. Connect a resistor ladder network from VOUT, PGTH and GND to set the PGOOD threshold level. PGOOD goes high when the internal FET's gate is enhanced and $V_{(PGTH)}$ is above $V_{(PGTHR)}$. PGOOD goes low when $V_{(PGTH)}$ goes below $V_{(PGTHF)}$. There is a deglitch of t_{PGOODR} , 1.2 msec (typical) at the rising edge and t_{PGOODF} , 2.1 μ s (typical) deglitch on the falling edge of PGOOD indication. PGOOD is a rated for 60 V and can be pulled to IN_SYS or OUT through a resistor. PGTH can be used for setting downstream's supply UVLO levels and PGOOD as enable and disable control.

9.3.2.1 PGTH as VOUT Sensing Input

The devices use PGTH as the output (Load) voltage monitor input and to set the down stream loads UVLO threshold. To set the input PGTH threshold, connect a resistor divider network from VOUT to PGTH terminal to GND as shown in the [Simplified Schematic](#). During a system fault recovery (example: OVP high to low or UVLO low to high) when the internal FET gate control is enabled, the device samples the PGTH information and decides whether to turn ON the FET with fast slew rate or dVdT mode based on the sampled $V_{(PGTH)}$ information.

[Figure 8-1](#) shows the turn ON behavior based on $V_{(PGTH)}$ information. During the fault recovery instance if the $V_{(PGTH)}$ level is above $V_{(PGTHF)}$ then the internal FET turns ON within a delay of $t_{OVP(dly_fast)}$ with fast slew rate (ignores the capacitance connected at dVdT pin) with thermal regulation loop enabled for a duration of $t_{CL_PLIM(dly)}$. Maximum current through the device during this operation is limited at $I_{(OL)}$ in TPS26630 and TPS26632 devices and at $2 \times I_{(OL)}$ in TPS26631, TPS26633, TPS26635 and TPS26636 devices for a maximum duration of $t_{CB(dly)}$. During the fault recovery instance if the $V_{(PGTH)}$ level is below $V_{(PGTHF)}$ then the device turns ON the internal FET in dVdT mode and the slew rate will depend on the dVdT capacitor value and maximum current through the devices is limited at $I_{(OL)}$. This way the device distinguishes between real system faults and system transients and the turn ON delay is controlled accordingly. This scheme ensures fast recovery during system tests like voltage interruption and brown-out tests, EMC testing like Electrical Fast Transients (IEC61000-4-4) and Surge (IEC61000-4-5). The fast turn ON during transient recovery feature can be disabled by connecting PGTH to GND. In this case, PGOOD will be pulled low.

9.3.3 Undervoltage Lockout (UVLO)

The TPS2663x devices feature an accurate $\pm 2\%$ adjustable undervoltage lockout functionality. When the voltage at UVLO pin falls below $V_{(UVLOF)}$ during input undervoltage fault, the internal FET quickly turns off and FLT is asserted. The UVLO comparator has a hysteresis of 78 mV (typical). To set the input UVLO threshold, connect a resistor divider network from IN supply to UVLO terminal to GND as shown in the [Simplified Schematic](#). The TPS2663x devices also features a factory set 15-V input supply undervoltage lockout

Figure 8-1 shows the turn ON behavior when UVLO pin voltage exceeds $V_{(UVLO\ R)}$ threshold.

an external signal FET (Q2) across BGATE, DRV and IN_SYS. Q2 acts as a pull down gate switch for Q1. In the applications where reverse polarity protection and reverse current blocking is not required then connect IN_SYS and IN together. Leave BGATE and DRV open as shown in Figure 9-6.

Figure 8-7 illustrates the reverse input polarity protection functionality.

The TPS2663x devices support a maximum differential voltage across $V_{(IN_SYS)} - V_{(OUT)}$ upto -85 V. This high voltage transients generally appear during the IEC61000-4-5 surge testing at the $V_{(IN_SYS)}$. This voltage stress appears across the external N-channel FET. The TPS2663x provides a gate drive (B_GATE) of 10.2 V (typical). The fast pull down gate switch Q2 pulls down the GATE of the Q1 during reverse current and reverse polarity fault events. Q2 should be at least 15-V, VDS rated FET with a maximum VGS rating of 20-V, Ciss ≤ 50 pF and VGTH(min) ≤ 3 V.

Figure 9-7. Input Reverse Polarity Response at -60 -V Input

9.3.6 Reverse Current Protection

The device monitors $V_{(IN_SYS)}$ and $V_{(OUT)}$ to provide true reverse current blocking when a reverse condition or input power failure condition is detected. The reverse comparator turns OFF the external blocking FET Q1 quickly as soon as $V_{(IN_SYS)} - V_{(OUT)}$ falls below -1 V. The total time taken to turn OFF the FET Q1 in this condition is $t_{RCB(fast_dly)} + t_{(Driver)}$. The delay due to the driver stage $t_{(Driver)}$ can be calculated using Equation 4.

$$t_{(Driver)} = -RDSON_{(Q2)} \times Ciss_{(Q1)} \times \ln\left(\frac{VGTH_{(Q1)}}{VB_{GATE}}\right) \quad (4)$$

where

- $RDSON_{(Q2)}$ is the on resistance of the fast pull down switch Q2

- $C_{iss(Q1)}$ is the input capacitance of the blocking FET Q1
- $V_{GTH(Q1)}$ is the GATE threshold voltage of the blocking FET Q1
- $V_{BGATE} = 10.2\text{ V}$ (typical)

In a typical system design, $t_{(Driver)}$ is generally 10% to 20% of $t_{RCB(fast_dly)}$ of 120 nsec (typical).

Figure 9-8 and Figure 9-9 illustrates the behavior of the system during input hot short circuit condition. The blocking FET Q1 is turned ON within 1.6 ms (typical) once the differential forward voltage $V_{(IN_SYS)} - V_{(OUT)}$ exceeds 67 mV (typical).

Figure 9-8. Input Hot Short Functionality at 24-V Supply

Figure 9-9. Input Hot-Short: Fast Trip Response (Zoomed)

The reverse comparator architecture has a supply line noise immunity resulting in a robust performance in noisy environments. This is achieved by controlling the turn OFF time of the internal FET based on the over-drive differential voltage $V_{(IN_SYS)} - V_{(OUT)}$ over $V_{(REVTH)}$. Higher the over-drive, faster the turn OFF time, $t_{RCB(dly)}$.

9.3.7 Overload and Short Circuit Protection

The device monitors the load current by sensing the voltage across the internal sense resistor. The FET current is monitored during start-up and normal operation.

9.3.7.1 Overload Protection

Set the current limit using Equation 5

$$I_{OL} = \frac{18}{R_{(ILIM)}} \quad (5)$$

where

- $I_{(OL)}$ is the overload current limit in Ampere
- $R_{(ILIM)}$ is the current limit resistor in k Ω

9.3.7.1.1 Active Current Limiting at 1x I_{OL} , (TPS26630 and TPS26632 Only)

The TPS2663x devices feature accurate overload current limiting and fast short circuit protection feature. With TPS26630 and TPS26632 if the load current exceeds the programmed current limit I_{OL} , the device regulates the current through it at I_{OL} eventually reducing the output voltage. The power dissipation across the device during this operation will be $(V_{IN} - V_{OUT}) \times I_{OL}$ and this could heat up the device and eventually enter into thermal shutdown. The maximum duration for the overcurrent through the FET $t_{CL_PLIM(dly)}$, 162 msec (typical). If the thermal shutdown occurs before this time the internal FET turns OFF and the subsequent operation (auto-retry or latch OFF) will depend on the MODE pin configuration in Table 9-1. Figure 9-10 and Figure 9-11 illustrate overload current limiting performance.

Figure 9-10. Overload Performance with TPS26630, TPS26632 during Load Step from 19 Ω to 9 Ω

Figure 9-11. Response During Coming Out of Overload Fault

9.3.7.1.2 Active Current Limiting with 2x I_{OL} Pulse Current Support, (TPS26631, TPS26633, TPS26635 and TPS26636 Only)

TPS26631, TPS26633, TPS26635 and TPS26636 after the start-up and with PGOOD high, if the load current exceeds I_{OL} , then an internal fixed $t_{CB(dly)}$, 25.5 msec (typical) timer starts. During this time the device will pass through the over current demanded by the load not more than 2 x I_{OL} above which the device will regulate at 2 x I_{OL} . After $t_{CB(dly)}$ time, the device regulates the current at I_{OL} . The power dissipation across the device during this operation will be $(V_{IN} - V_{OUT}) \times I_{OL}$ and this could heat up the device and eventually enter into thermal shutdown. The maximum duration for the internal FET in current regulation is $t_{CL_PLIM(dly)}$. The subsequent operation will be based on the MODE setting (either auto-retry or latch OFF) in [Table 9-1](#).

The 2 x I_{OL} pulse current support is activated only after PGOOD goes high. If PGOOD is in low state such as during start-up operation or during auto-retry cycles, the 2 x I_{OL} pulse current support is not activated and the device limits the current at I_{OL} level.

[Overload Performance with TPS26631, TPS26633, TPS26635 and TPS26636 during Load Step from 19 \$\Omega\$ to 9 \$\Omega\$](#) and [Response during Coming Out of Overload Fault](#) illustrate overload current limiting performance.

$V_{IN_SYS} = 24\text{ V}$ MODE connected to GND (Auto-Retry) $R_{ILIM} = 9\text{ k}\Omega$

Figure 9-12. Overload Performance with TPS26631, TPS26633, TPS26635 and TPS26636 during Load Step from 19 Ω to 9 Ω

$V_{IN_SYS} = 24\text{ V}$ MODE connected to GND (Auto-Retry) $R_{ILIM} = 9\text{ k}\Omega$

Figure 9-13. Response during Coming Out of Overload Fault

The TPS2663x devices feature ILIM pin short and open fault detection and protection. The internal FET is turned OFF when ILIM pin is detected short or open to GND and it remains OFF till the ILIM pin fault is removed.

Refer to [Figure 8-2](#) for more information on $t_{CB(dly)}$ and $t_{CL_PLIM(dly)}$ parameter measurement information.

9.3.7.2 Short Circuit Protection

During a transient output short circuit event, the current through the device increases rapidly. As the current-limit amplifier cannot respond quickly to this event due to its limited bandwidth, the device incorporates a fast-trip comparator. The fast-trip comparator architecture is designed for fast turn OFF $t_{FASTTRIP(dly)} = 1\text{ }\mu\text{s}$ (typical) with $I_{(SCP)} = 45\text{ A}$ of the internal FET during an output short circuit event. The fast-trip threshold is internally set to $I_{(FASTTRIP)}$. The fasttrip circuit holds the internal FET off for only a few microseconds, after which the device turns back on slowly, allowing the current-limit loop to regulate the output current to $I_{(OL)}$. Then the device functions similar to the overload condition. [Figure 8-14](#) illustrates output hot-short performance of the device.

$V_{IN_SYS} = 24\text{ V}$ $R_{ILIM} = 9.09\text{ k}\Omega$

Figure 9-14. Output Hot-Short Response

The fast-trip comparator architecture has a supply line noise immunity resulting in a robust performance in noisy environments. This is achieved by controlling the turn OFF time of the internal FET based on the overcurrent level, $I_{FASTTRIP}$ through the device. Higher the overcurrent, faster the turn OFF time, $t_{FASTTRIP(dly)}$. At overload current level in the range of $I_{FASTTRIP} < I_{OUT} < I_{SCP}$ the fast-trip comparator response is 3.2 μs (typical).

9.3.7.2.1 Start-Up With Short-Circuit On Output

When the device is started with short-circuit on the output, the current begins to limit at I_{OL} . Due to high power dissipation of $V_{IN} \times I_{OL}$ within the device the junction temperature increases. Subsequently, the thermal regulation control loop limits the load current to regulate the junction temperature at $T_{(J_REG)}$, 145°C (typical) for a duration of $t_{(Treg_timeout)}$, 2.5 sec (typical). Subsequent operation of the device depends on the MODE configuration (Auto-Retry or latch OFF) setting as per the Table 9-1. FLT gets asserted after $t_{(Treg_timeout)}$ and remains asserted till the output short-circuit is removed. Figure 9-15 illustrates the behavior of the device in this condition.

A.

 $V_{IN} = 24V$ $R_{LIM} = 3\text{ k}\Omega$

Figure 9-15. Start-Up With Short on Output

9.3.8 Output Power Limiting, PLIM (TPS26632, TPS26633, TPS26635 and TPS26636 Only)

The TPS26630 and TPS26631 devices with a fixed overcurrent limit threshold the maximum output power limit increases linearly with supply input. Electrical industrial process control equipment such as PLC CPU needs to comply with standards like IEC61010-1 and UL1310 for fire safety, which require limited energy and power circuits. Limiting the output power becomes a challenge in such high power applications where the operating supply voltage range is wide. The TPS26632, TPS26633, TPS26635 and TPS26636 devices integrate adjustable output power limiting functionality that simplifies the system design requiring compliance in accordance to this standard.

Connect a resistor from PLIM to GND as shown in Figure 9-16 to set the output power limiting value. If output power limiting is not required then connect PLIM to GND directly. This disables the PLIM functionality.

During an over power load event the TPS26632 limits the output power at the programmed value set by PLIM resistor. This indirectly results in the device operation in current limiting mode with steady state output voltage and current set by the load characteristics and $P_{LIM} = V_{OUT} \times I_{OUT}$. Power Limit, Current limit vs Supply Voltage shows the output power limit and current limit characteristics of TPS26632 with 100 W power limit setting. The maximum duration for the device in power limiting mode is 162 msec (typical), $t_{CL_PLIM(dly)}$. After this time, the device operates either in auto-retry or latch off mode based on MODE pin configuration in Table 9-1.

During an over power load event the TPS26633, TPS26635 and TPS26636 allows the extra power for a maximum duration of $t_{CB(dly)}$, 25.5 msec (typical). The maximum power during this time is limited to $V_{OUT} \times 2 \times$

27

$$V_{(IMON)} = [I_{(OUT)} \times GAIN_{(IMON)}] \times R_{(IMON)} \quad (7)$$

Where,

- $GAIN_{(IMON)}$ is the gain factor $I_{(IMON)}:I_{(OUT)} = 27.9 \mu A/A$ (Typical)
- $I_{(OUT)}$ is the load current

Refer to [Figure 6-13](#) for IMON output versus load current plot. [Figure 9-19](#) illustrates IMON performance.

Figure 9-19. IMON Response During a Load Step

The IMON pin must not have a bypass capacitor to avoid delay in the current monitoring information.

9.3.10 FAULT Response ($\overline{FLT}$)

The $\overline{FLT}$ open-drain output asserts (active low) under the faults events such as undervoltage, overvoltage, overload, power limiting, reverse current, ILIM pin short and thermal shutdown conditions. The device is designed to eliminate false reporting by using an internal "de-glitch" circuit for fault conditions without the need for an external circuitry. $\overline{FLT}$ can be left open or connected to GND when not used.

9.3.11 IN_SYS, IN, OUT and GND Pins

Connect a minimum of 0.1 μ F capacitor across IN_SYS and GND. For systems and applications where reverse polarity protection and/or reverse current blocking feature is required

- Connect a N-channel FET between IN_SYS and IN with source of the FET connected to IN_SYS, Drain at IN and GATE to B_GATE.
- Connect a N-channel signal FET with GATE to DRV, Drain to B_GATE, Source to IN_SYS

If the external N-channel FET is not used then connect IN_SYS and IN together and leave B_GATE and DRV pins floating as shown in [Figure 8-7](#). Do not leave any of the IN and OUT pins un-connected.

9.3.12 Thermal Shutdown

The device has a built-in overtemperature shutdown circuitry designed to protect the internal FET, if the junction temperature exceeds $T_{(TSD)}$, 165°C (typical). After the thermal shutdown event, depending upon the mode of fault response configured as per the [Table 9-1](#), the device either latches off or commences an auto-retry cycle of 648 msec (typical), $t_{(TSD_retry)}$ after $T_J < [T_{(TSD)} - 11^\circ C]$. During the thermal shutdown, the fault pin $\overline{FLT}$ pulls low to indicate a fault condition.

9.3.13 Low Current Shutdown Control ($\overline{SHDN}$)

The internal, external FET and hence the load current can be switched off by pulling the $\overline{SHDN}$ pin below 0.8-V threshold with a micro-controller GPIO pin or can be controlled remotely with an opto-isolator device. The device

quiescent current reduces to 21 μA (typical) in shutdown state. To assert $\overline{\text{SHDN}}$ low, the pull down must have sinking capability of at least 10 μA . To enable the device, $\overline{\text{SHDN}}$ must be pulled up to at least 2 V. Once the device is enabled, the internal FET turns on with dVdT mode. [Turnon Control With \$\overline{\text{SHDN}}\$](#) and [Response during Coming Out of Overload Fault](#) illustrate the performance of $\overline{\text{SHDN}}$ control.

Figure 9-20. Turnon Control With $\overline{\text{SHDN}}$

Figure 9-21. Turnoff Control With $\overline{\text{SHDN}}$

9.4 Device Functional Modes

The TPS2663x devices respond differently to overload with MODE pin configurations. The operational differences are explained in [Table 9-1](#).

Table 9-1. Device Operational Differences Under Different MODE Configurations

MODE Pin Configuration	Overload Protection Operation	Device
Open	Active Current limiting at 1x for a maximum duration of $t_{CL_PLIM(dly)}$. There after Latches OFF. Latch reset by toggling $\overline{SHDN}$ low to high or UVLO low to high or power cycling IN_SYS.	TPS26630, TPS26632
	Active Current limiting at 2x for $t_{CB(dly)}$ duration followed with 1x current limiting for a maximum duration of $t_{CL_PLIM(dly)}$. There after Latches OFF. 	Active Current limiting at 2x for $t_{CB(dly)}$ duration followed with 1x current limiting for a maximum duration of $t_{CL_PLIM(dly)}$. There after auto-retries after a delay of $t_{(TSD_retry)}$.	TPS26631, TPS26633, TPS26635

Refer to [Figure 8-2](#) for more information on $t_{CB(dly)}$ and $t_{CL_PLIM(dly)}$ parameter measurement information.

10 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

10.1 Application Information

The TPS2663x is an industrial eFuse, typically used for Hot-Swap and Power rail protection applications. It operates from 4.5 V to 60 V with adjustable current limit, output power limit, overvoltage, undervoltage and reverse polarity protections. The device aids in controlling in-rush current and provides robust protection against reverse current and filed miss-wiring conditions for systems such as PLCs, Industrial PCs, Control and Automation and Sensors. The device also provides robust protection for multiple faults on the system rail

The [Detailed DesignProcedure](#) section can be used to select component values for the device. Additionally, a spreadsheet design tool [TPS2663 Design Calculator](#) is available in the web product folder.

10.2 Typical Application: Power Path Protection in a PLC System

Figure 10-1. A Typical CPU (PLC Controller) System Block Diagram

The PLC system is usually connected to an external 24-V DC power supply to provide power to the controller unit, backplane, and I/O modules. Input protection circuits are required to protect the PLC from faults such as overvoltage, undervoltage, and overload. Because input supply connectors are screw type, there can always be a possibility of reverse supply connections. Protection circuits should block the reverse polarity to protect the PLC from possible negative voltages. At the same time, every PLC is tested for electrostatic discharge

(ESD) according to IEC 61000-4-2, burst pulses (EFT) according to IEC 61000- 4-4, energy single pulse (surge) according to IEC 61000-4-5, voltage drops and interruptions. Figure 10-1 shows a system block diagram of PLC controller unit along with the input protection socket. The TPS2663x devices offer a plug and play input protection solution for such applications. For more information about this end equipment refer to the TI application site on [Programmable Logic Controller \(PLC\), DCS & PAC: CPU \(PLC Controller\)](#).

Figure 10-2. 24-V, 2-A eFuse Input Protection Circuit for Industrial PLC, CNC CPU

10.2.1 Design Requirements

Table 10-1 shows the Design Requirements for TPS2663x.

Table 10-1. Design Requirements

DESIGN PARAMETER		EXAMPLE VALUE
V _(IN)	Typical input voltage	24 V
V _(UV)	Undervoltage lockout set point	18 V
V _(OV)	Overvoltage cutoff set point	33 V
I _(LIM)	Overload Current limit	2 A
I _(INRUSH)	Inrush Current limit	500 mA
P _(OUT)	Output Load	15 W (DC-DC) with 15 V VIN _{minDC-DC}
T _(FAIL_TR)	Power Interruption time	10 msec
P _(Surge)	IEC61000-4-5 Surge test level	± 500 V, 2 Ω generator impedance

10.2.2 Detailed Design Procedure

10.2.2.1 Programming the Current-Limit Threshold—R_(ILIM) Selection

The R_(ILIM) resistor at the ILIM pin sets the overload current limit, this can be set using Equation 8.

$$R_{(ILIM)} = \frac{18}{I_{OL}} = 9k\Omega \quad (8)$$

where

- I_{LIM} = 2 A

Choose the closest standard 1% resistor value : R_(ILIM) = 9.09 kΩ

10.2.2.2 Undervoltage Lockout and Overvoltage Set Point

The undervoltage lockout (UVLO) and overvoltage trip point are adjusted using an external voltage divider network of R_1 , R_2 and R_3 connected between IN_SYS, UVLO, OVP and GND pins of the device. The values required for setting the undervoltage and overvoltage are calculated by solving [Equation 9](#) and [Equation 10](#).

$$V_{(OVPR)} = \frac{R_3}{R_1 + R_2 + R_3} \times V_{(OV)} \quad (9)$$

$$V_{(UVLOR)} = \frac{R_2 + R_3}{R_1 + R_2 + R_3} \times V_{(UV)} \quad (10)$$

For minimizing the input current drawn from the power supply $\{I_{(R123)} = V_{(IN)} / (R_1 + R_2 + R_3)\}$, it is recommended to use higher value resistance for R_1 , R_2 and R_3 .

However, the leakage current due to external active components connected at resistor string can add error to these calculations. So, the resistor string current, $I_{(R123)}$ must be chosen to be 20x greater than the leakage current of UVLO and OVP pins.

From the device electrical specifications, $V_{(OVPR)} = 1.2$ V and $V_{(UVLOR)} = 1.2$ V. From the design requirements, $V_{(OV)}$ is 33 V and $V_{(UV)}$ is 18 V. To solve the equation, first choose the value of $R_3 = 34$ k Ω and use [Equation 9](#) to solve for $(R_1 + R_2) = 916$ k Ω . Use [Equation 10](#) and value of $(R_1 + R_2)$ to solve for $R_2 = 29.4$ k Ω and finally $R_1 = 887$ k Ω .

Choose the closest standard 1% resistor values: $R_1 = 887$ k Ω , $R_2 = 29.4$ k Ω , and $R_3 = 34$ k Ω .

The UVLO and the OVP pins can also be connected to the GND pin to enable the internal default $V_{(OV)} = 34.2$ V and $V_{(UV)} = 15.6$ V.

10.2.2.3 Output Buffer Capacitor – C_{OUT}

During the power interruption time T_{FAIL_TR} the output capacitor C_{OUT} of the TPS26630 provides energy to the 15 W DC-DC converter load. Use [Equation 11](#) to compute the required buffer capacitor C_{OUT}

$$C_{OUT} = \frac{2 \times P_{(DC-DC)} \times T_{FAIL_TR}}{V_{(IN_SYS)}^2 - V_{(UV_DC-DC)}^2} \quad (11)$$

where

- $P_{(DC-DC)} = 15$ W/ η . Assuming efficiency of 95%, $P_{(DC-DC)} = 15.8$ W
- $T_{FAIL_TR} = 10$ msec
- $V_{(IN_SYS)} = 24$ V
- $V_{(UV_DC-DC)} = 15$ V

$C_{OUT} = 0.9$ mF. Choose a capacitor with $\pm 10\%$ tolerance, $C_{OUT} = 1$ mF/35 V electrolytic capacitor. [Figure 9-4](#) and [Figure 10-5](#) illustrate the performance during the power interruption tests on TPS26630. [Figure 9-8](#) illustrate the performance on TPS26631.

10.2.2.4 PGTH Set Point

Set the V_{PGTHF} threshold at the down-stream DC-DC converter UVLO falling threshold. VIN minimum operating voltage of the DC-DC converter is at 15 V. Assuming UVLO to be at 20% lower level, $V_{UVLO_DC-DC} = 12$ V. Use [Equation 12](#) to calculate R_4 and R_5 .

$$V_{(PGTHF)} = \frac{R_5}{R_4 + R_5} \times V_{UVLO_DC-DC} \quad (12)$$

$V_{(PGTHF)} = 1.14$ V. Assuming $R_5 = 56$ k Ω , R_4 comes out to be approximately 499 k Ω .

10.2.2.5 Setting Output Voltage Ramp Time—(t_{dVdT})

Use Equation 1 and Equation 2 to calculate required $C_{(dVdT)}$ for achieving an inrush current of 500 mA. $C_{(dVdT)} = 0.1 \mu\text{F}$. Figure 9-3 illustrates the inrush current limiting performance during 24-V hot-plug in condition.

10.2.2.5.1 Support Component Selections— R_{PGOOD} and $C_{(IN)}$

The R_{PGOOD} serves as pull-up for the open-drain output. The current sink by this pin must not exceed 10 mA (see the *Absolute Maximum Ratings* table). Typical resistance value in the range of 10 k Ω to 100 k Ω is recommended for R_{PGOOD} . Connect PGOOD directly to the EN pin of the DC-DC converter. Figure 10-6 and Figure 9-8 illustrate the power up and power down performance of the system respectively. The $C_{(IN)}$ is a local bypass capacitor to suppress noise at the input. A minimum of 1 μF is recommended for $C_{(IN)}$ for limit the slew rates during the surge test.

10.2.2.6 Selecting Q1, Q2 and TVS Clamp for Surge Protection

For $\pm 500\text{-V}$, 2- Ω surge, typically a SMC sized TVS like SMCJ36CA clamps the voltage around $\pm 55\text{ V}$. During the negative surge strike, the input voltage V_{IN_SYS} spikes to -55 V . This results in a voltage stress of $-(55\text{ V} + 24\text{ V}) = -79\text{ V}$ across the external blocking FET Q1. Choose at least a 80-V rated N-channel FET. B_GATE drive is in the range of 10 V to 14 V. Select a suitable FET with the target $R_{DS(on)}$ specified at this gate drive voltage. The fast pull down gate switch Q2 pulls down the GATE of the Q1 during the reverse current event appearing during the surge test. Q2 should be at least 15-V V_{DS} rated FET with a maximum V_{GS} rating of 20-V, $C_{iss} \leq 50\text{ pF}$ and $V_{GTH(min)} \leq 3\text{ V}$. CSD19537Q3 and BSS138 are selected for Q1 and Q2 respectively. Figure 9-9 and Figure 9-10 illustrate the performance of the system during the surge testing.

10.3.3 Input Protection for a Compact 24-V Auxiliary Power Supply for Servo Drives

TPS2663x eFuse protects the system from common faults such as reverse polarity, reverse power flow, overvoltage, undervoltage and overcurrents along with a robust EMC immunity performance. Refer to, [Compact, efficient, 24-V input auxiliary power supply reference design for servo drives](#) TI Design Guide for further information.

10.4 Do's and Don'ts

- In the applications where reverse polarity protection is required use external FETs Q1 and Q2.
- Connect at least a 300-kΩ resistor across UVLO and IN_SYS in the applications where reverse polarity protection is required.

11 Power Supply Recommendations

The TPS2663x eFuse is designed for the supply voltage range of $4.5\text{ V} \leq V_{IN} \leq 60\text{ V}$. If the input supply is located more than a few inches from the device, an input ceramic bypass capacitor higher than $0.1\text{ }\mu\text{F}$ is recommended. Power supply must be rated higher than the current limit set to avoid voltage droops during overcurrent and short circuit conditions.

11.1 Transient Protection

In case of short circuit and overload current limit, when the device interrupts current flow, input inductance generates a positive voltage spike on the input and output inductance generates a negative voltage spike on the output. The peak amplitude of voltage spikes (transients) depends on the value of inductance in series to the input or output of the device. These transients can exceed the [Absolute Maximum Ratings](#) of the device if steps are not taken to address the issue.

Typical methods for addressing transients include:

- Minimizing lead length and inductance into and out of the device
- Using large PCB GND plane
- Use of a Schottky diode across the output and GND to absorb negative spikes
- A low value ceramic capacitor (C_{IN}) to approximately $0.1\text{ }\mu\text{F}$) to absorb the energy and dampen the transients.

The approximate value of input capacitance can be estimated with [Equation 14](#)

$$V_{\text{spike(Absolute)}} = V_{(IN)} + I_{(Load)} \times \sqrt{\frac{L_{(IN)}}{C_{(IN)}}} \quad (14)$$

where

- $V_{(IN)}$ is the nominal supply voltage
- $I_{(LOAD)}$ is the load current
- $L_{(IN)}$ equals the effective inductance seen looking into the source
- $C_{(IN)}$ is the capacitance present at the input

Some applications may require additional Transient Voltage Suppressor (TVS) to prevent transients from exceeding the *Absolute Maximum Ratings* of the device. These transients can occur during positive and negative surge tests on the supply lines. In such applications it is recommended to place at least 1 μF of input capacitor.

The circuit implementation with optional protection components (a ceramic capacitor, TVS and schottky diode) is shown in Figure 10-1.

* Optional components needed for suppression of transients

Figure 11-1. Circuit Implementation with Optional Protection Components for TPS2663x

12 Layout

12.1 Layout Guidelines

- For all the applications, a 0.1 μF or higher value ceramic decoupling capacitor is recommended between IN_SYS terminal and GND.
- The external FET Q1 should be placed with DRAIN close to the V_{IN} pins of the IC and connected through a plane. The fast pull down switch Q2 DRAIN and SOURCE should be placed very close to the GATE and SOURCE terminals of Q1 with very short loop. See [Figure 12-1](#) and [Figure 12-2](#) for a typical PCB layout example.
- The optimum placement of decoupling capacitor is closest to the IN_SYS and GND terminals of the device. Care must be taken to minimize the loop area formed by the bypass-capacitor connection, the IN_SYS terminal, and the GND terminal of the IC.
- High current carrying power path connections must be as short as possible and must be sized to carry at least twice the full-load current.
- Locate all the TPS2663x family support components $R_{\text{(ILIM)}}$, $C_{\text{(dVdT)}}$, $R_{\text{(IMON)}}$, UVLO, OVP and PGTH resistors close to their connection pin. Connect the other end of the component to the GND with shortest trace length.
- The trace routing for the R_{ILIM} component to the device must be as short as possible to reduce parasitic effects on the current limit and current monitoring accuracy. These traces must not have any coupling to switching signals on the board.
- Protection devices such as TVS, snubbers, capacitors, or diodes must be placed physically close to the device they are intended to protect, and routed with short traces to reduce inductance. For example, a protection Schottky diode is recommended to address negative transients due to switching of inductive loads, and it must be physically close to the OUT and GND pins.
- Thermal Considerations: When properly mounted, the PowerPAD package provides significantly greater cooling ability. To operate at rated power, the PowerPAD must be soldered directly to the board GND plane directly under the device. Other planes, such as the bottom side of the circuit board can be used to increase heat sinking in higher current applications.

13.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of ≤ 1000 ppm threshold. Antimony trioxide based flame retardants must also meet the ≤ 1000 ppm threshold requirement.

⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

GENERIC PACKAGE VIEW

VQFN - 1 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

Images above are just a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

4204104/H

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

4219016 / A 08/2017

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/sluea271).
5. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SOLDER PASTE EXAMPLE

PowerPAD™ PLASTIC SMALL OUTLINE

4073225-4/1 05/11

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Body dimensions do not include mold flash or protrusions. Mold flash and protrusion shall not exceed 0.15 per side.
 - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <<http://www.ti.com>>.
 - E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
 - E. Falls within JEDEC MO-153

PowerPAD is a trademark of Texas Instruments.

PowerPAD is a trademark of Texas Instruments.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. Reference JEDEC registration MO-153.
5. Features may differ or may not be present.

EXPOSED METAL SHOWN
SCALE: 10X

SOLDER MASK DETAILS

4224598/A 10/2018

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
8. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature numbers SLMA002 (www.ti.com/lit/slma002) and SLMA004 (www.ti.com/lit/slma004).
9. Size of metal pad may vary due to creepage requirement.
10. Vias are optional depending on application, refer to device data sheet. It is recommended that vias under paste be filled, plugged or tented.
