#### Note:

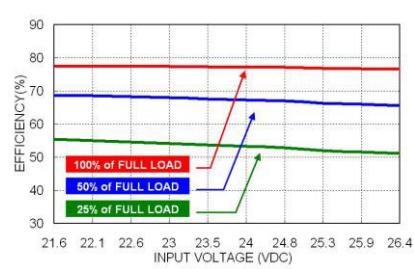

- The output requires a minimum loading on the output to maintain specified regulation. Operation under no-load condition will not damage these devices; however they may not meet all listed specification.
- The extra protection of the pads between input and output should be needed in order to ensure that the isolation function won't be affected after the module mounts on the PCB. (For detailed information, please refer to RECOMMENDED PAD LAYOUT.)

**CAUTION:** This power module is not internally fused. An input line fuse must always be used.

## FUSE CONSIDERATION

This power module is not internally fused. An input line fuse must always be used.

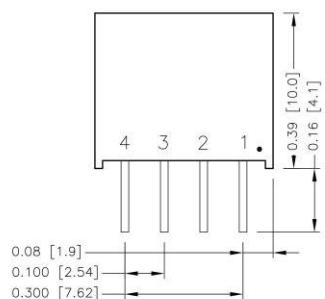

This encapsulated power module can be used in a wide variety of applications, ranging from simple stand-alone operation to an integrated part of sophisticated power architecture.

To maximum flexibility, internal fusing is not included; however, to achieve maximum safety and system protection, always use an input line fuse. The input line fuse suggest as below :

Model	Fuse Rating (A)	Fuse Type
EUR01-33□□□	0.8	Slow-Blow
EUR01-05□□□	0.5	Slow-Blow
EUR01-12□□□	0.315	Slow-Blow
EUR01-15□□□、EUR01-24□□□	0.16	Slow-Blow

The table based on the information provided in this data sheet on inrush energy and maximum DC input current at low Vin.

## THERMAL CONSIDERATIONS

The power module operates in a variety of thermal environments.

However, sufficient cooling should be provided to help ensure reliable operation of the unit.

Heat is removed by conduction, convection, and radiation to the surrounding environment.

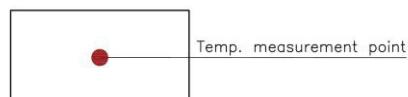

Proper cooling can be verified by measuring the point as the figure below.

The temperature at this location should not exceed "Maximum case temperature".

When operating, adequate cooling must be provided to maintain the test point temperature at or below "Maximum case temperature".

You can limit this temperature to a lower value for extremely high reliability.

- Thermal test condition with vertical direction by natural convection (20LFM).
