Introduction

This keyboard uses an analog input to read the five key state which saves IO resource for the Arduino. It can be used together with our IO Expansion Shield_For Arduino(V5)_ (SKU:_DFR0088) to make amazing interactive project.

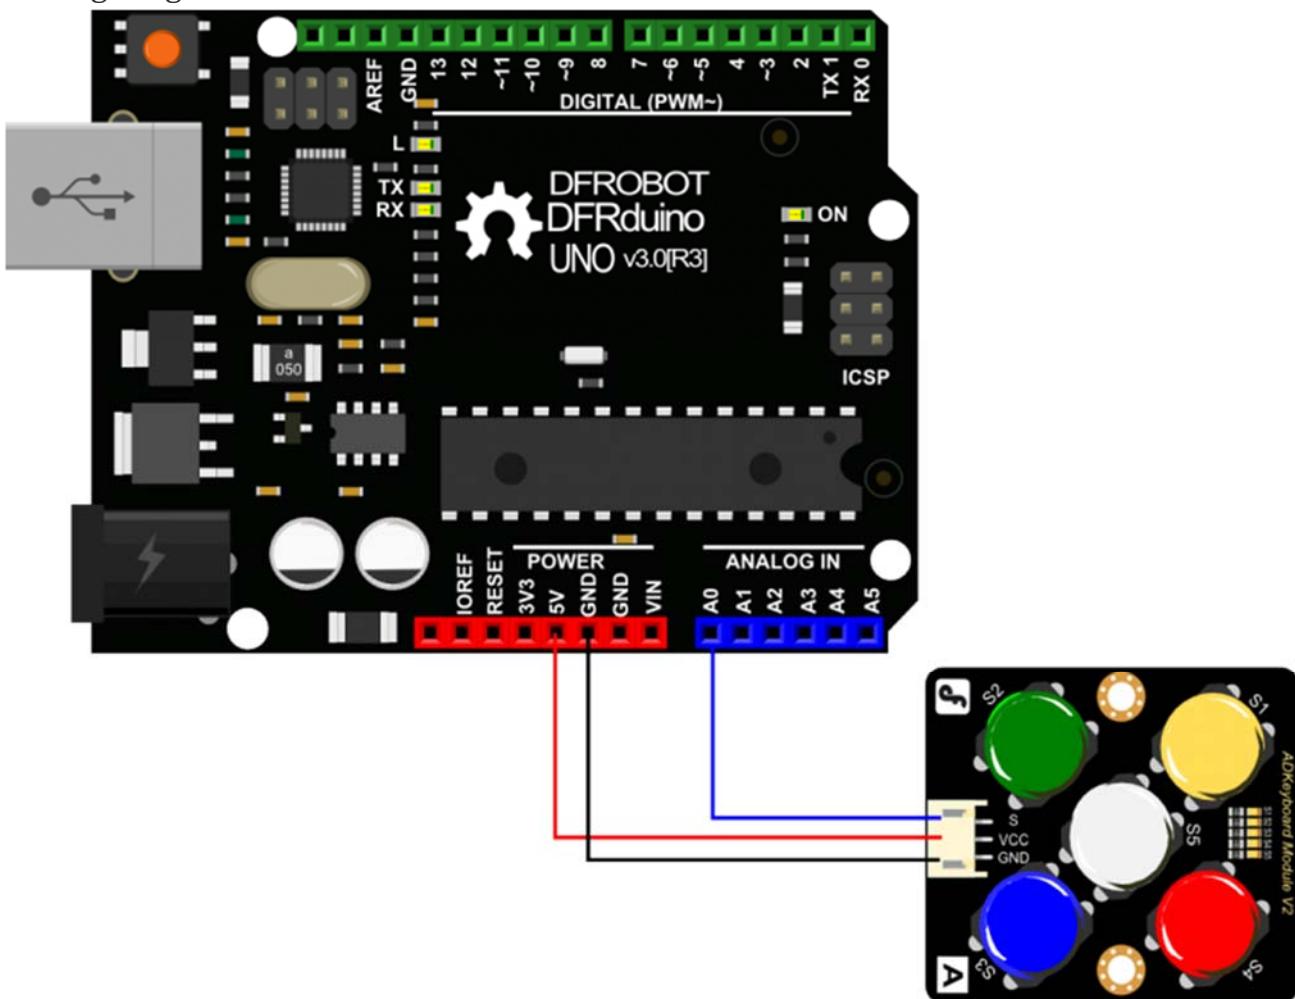

Specifications

- Supply voltage: 5V
- Interface: Analog
- Size: 40x33mm

Sample Code

```
//ADKeyboard Module
//Developed by DFRobot.com
//Last modified 30/11/2011
//Version 1.0

int adc_key_val[5] ={600,650, 700, 800, 900 } ;
int NUM_KEYS = 5;
int adc_key_in;
int key=-1;
int oldkey=-1;

void setup()
{
    pinMode(13, OUTPUT); //we'll use the debug LED to output a heartbeat
    Serial.begin(9600); // 9600 bps
}

void loop()
{
    adc_key_in = analogRead(0); // read the value from the sensor
    digitalWrite(13,LOW);
    key = get_key(adc_key_in); // convert into key press

    if (key != oldkey) // if keypress is detected
    {
        delay(50); // wait for debounce time
        adc_key_in = analogRead(0); // read the value from the sensor
        key = get_key(adc_key_in); // convert into key press
        if (key != oldkey)
        {
            oldkey = key;
            if (key >=0){
                digitalWrite(13,HIGH);
                switch(key)
                {

```

```

        case 0:Serial.println("S1 OK");
            break;
        case 1:Serial.println("S2 OK");
            break;
        case 2:Serial.println("S3 OK");
            break;
        case 3:Serial.println("S4 OK");
            break;
        case 4:Serial.println("S5 OK");
            break;
    }
}
}

delay(100);
}

// Convert ADC value to key number
int get_key(unsigned int input)
{
    int k;
