BASIC PAD PATTERNS

The basic pad layout with dimensions is shown in Figure 22. This is sufficient for low power dissipation applications, but power MOSFET semiconductor performance requires a greater copper pad area, particularly for the drain leads.

The minimum recommended pad pattern shown in Figure 23 improves the thermal area of the drain THIS DEVICE PLES connections (pins 5, 6, 7, 8) while remaining within the

confines of the basic footprint. The drain copper area is 0.0019 sq. in. (or 1.22 sq. mm). This will assist the power dissipation path away from the device (through the copper lead-frame) and into the board and exterior chassis (if applicable) for the single device. The addition of a further copper area and/or the addition of vias to other board layers will enhance the performance still further.
