

PRODUCT GUIDE

R701 MICROSTEPPING DRIVER

MAIN FEATURES

- √ Voltage: +24 to 80 VDC
- $\sqrt{}$ Current: 0.3 to 7.0 Amps Peak, using a resistor for limiting current
- $\sqrt{100}$ Hold current: 33% of default (100% can be set via jumpers internally)
- √ Step resolution: 10 Microstep
- √ Speed: (step frequency: 200 kHz)
- $\sqrt{}$ Inputs: step pulses, direction change, disable/enable driver

ACCESSORIES

- No accessories are needed for this product.
- Other units needed to run this: Power Supply, Function Generator (or other squarewave signal source), Step Motor, Resistors.

DETAILED FEATURES

- Step frequency: 0 to 200 kHz
- Step pulse time on falling edge (0):
 0.5 microseconds minimum (0.5 x 10-6)
- Step pulse time on rising edge (1): 4.0 microseconds minimum (4.0 x 10-6)
- Direction setup: 1 msec minimum (20 microseconds min hold time after step edge)
- Operating temperature: 0° to 70° C
- Humidity range: 0 to 95% (non-condensing)
- Power dissipation: 1 to 12 Watts (1 to 7 Amps)

ADJUSTABLE TRIMPOT

The potentiometer shown on the board can be rotated using a screwdriver. It's recommended to rotate the motor at 0.25 RPS. Then to adjust the potentiometer until there is the least amount of vibration and noise coming out of the motor. This will be the position that the driver will perform smoothly with a given motor and power supply voltage.

The adjustment will alter the current waveform coming out of the driver and into the motor coils.

CONNECTION SPECIFICATIONS

| | Resistance | Pin # | Color |
|-------|------------|-------|-----------------|
| Amps) | (Onnis) | 1 | Power Ground |
| 1 | 8.2K | 2 | +24 to 80 VDC |
| 2 | 18K | 2 | A Phaco |
| 3 | 36K | | Arnase |
| 4 | 601/ | 4 | A Bar Phase |
| 4 | 02h | 5 | B Phase |
| 5 | 120K | 6 | B Bar Phase |
| 6 | 270K | 7 | Disable Input |
| | | 8 | Direction Input |
| | | 9 | Step Input |
| | | 10 | +5 VDC |
| | | 11 | Current Set |
| | | 12 | Current Set |

KEY SELLING FEATURES

- Powerhouse Driver-up to 7 amps and 80 vDC
- Low Cost
- Easy to Use

COMMON TECH SUPPORT QUESTIONS / RMA ISSUES

Verify power supply is switched OFF prior to checking any wiring connections

BURNED OR BLOWN DRIVER (LOW INDUCTANCE):

Wrong connection (Phases)

MOTORS ARE HOT:

Check wiring. Motor phases could be crossed (A is in B or B Bar, etc)

MOTORS DO NOT ROTATE:

Check connection between motor and drive. If, for example, the "A" and "A Bar" connection is actually connected to an "A" phase wire and a "B" phase wire, then the driver will not run.

(CAUTION: Doing this could burn the driver) Be sure they have connected an external +5VDC power supply for the optos.

POWER SUPPLY IS DRAWING EXCESSIVE CURRENT:

Check if the polarity is switched on the main power supply. See connection chart on previous page. Unpluggin a motor from the driver while power is still on will burn the driver chips. The motor has Back EMF voltage and when disconnecting the motor from

NOTES

the driver, it could send voltage back into the driver. Once they are burned, something is short-circuited on the driver board and will draw excessive current from power supply.

MOTOR ROTATES, BUT IRRATICALLY, NOT SMOOTHLY:

Check resistance of motor, ensure that Phase A and Phase B are equal If one of the two drivers are blown, then only half of the driver works. If this is the case, turning on and off the pulses to move and stop the motor might cause the motor to rotate CW and CCW at random times, when it should only rotate in one direction. Half the torque is available too.

Acceleration or speed is too fast for the motor. Lower the speed until it steps smoothly

You could be hitting a resonant spot, microstep the unit to see smoother results

Ensure step pulses are from a source with 5V amplitude pulses, 50% duty cycle, pulse train, and is a square wave. Check correct wiring.
