QUAD ECL TO TTL TRANSLATOR

F10K VOLTAGE COMPENSATED ECL

DESCRIPTION — The F10125 and F10525 are Quad Translators for converting F10K logic levels to TTL logic levels. Differential inputs allow each circuit to be used as an inverting, non-inverting or as a differential receiver. An Internal reference voltage generator provides V_{BB} on Pin 1 for single-ended operation or for use in Schmitt trigger applications. The outputs, which will go LOW when the inputs are left unconnected, have a fan-out of 10 Schottky TTL loads.

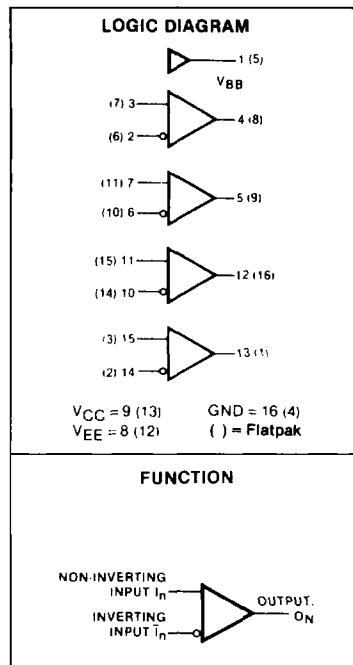

When used in the differential mode, the inputs have a common mode rejection of ± 1 V, making this device tolerant of ground offsets and transients between the signal source and the translator.

SWITCHING CIRCUIT AND WAVEFORMS

50Ω termination to ground located in each scope channel input.

$C_L = 25 \text{ pF}$, including fixture

All input and output cables to the scope are equal lengths of 50Ω coaxial cable. Wire length should be $< \frac{1}{4}$ inch from TP_{IN} to input pin and TP_{OUT} to output pin.

One input from each gate must be tied to V_{BB} during testing.
