

# TXV0106 6-Bit Fix Direction Low Skew, Low-Jitter Voltage Translator or Buffer

## 1 Features

- Configurable design allows each port to operate with a power supply range from 1.2 V to 3.6 V
- Supports up to 500Mbps for 1.65 V to 3.6 V
- Meets RGMII 2.0 timing specifications:
  - < 750 ps rise and fall time
  - < ± 5 % duty cycle distortion
  - < ± 400 ps channel to channel skew
  - Up to 250Mbps/channel
- [Integrated 10 Ω damping output resistor](#) to minimize signal reflections
- High drive strength (up to 12 mA at 3.6 V)
- Fully configurable [symmetric dual-rail design](#)
- Optimal signal integrity performance with 390ps peak-to-peak jitter for 1.8 V to 3.3 V
- Features [V<sub>CC</sub> isolation and V<sub>CC</sub> disconnect](#)
- I<sub>off</sub> supports partial-power-down mode operation
- Latch-up performance exceeds 100 mA per JESD 78, Class II
- ESD protection exceeds JESD 22:
  - 2000-V Human-Body Model
  - 1000-V Charged-Device Model
- Low power consumption:
  - 10-μA maximum (25°C)
  - 20-μA maximum (–40°C to 125°C)
- Operating temperature from –40°C to +125°C

## 2 Applications

- [Medium or short range radar](#)
- [ADAS domain controller](#)
- [HVAC controller design](#)
- [Machine vision camera](#)
- [Rack sever motherboard](#)
- [IP telephone](#)

## 3 Description

The TXV0106 is a 6-bit, dual-supply fixed-direction low-skew, low jitter voltage translation device. This device can be used for redriving, voltage translation and power isolation when implementing skew sensitive interface, such as RGMII between Ethernet MAC and PHY. The Ax I/O pins and enable pin ( $\overline{OE}$ ) are referenced to V<sub>CCA</sub> logic levels, and Bx I/O pins are referenced to V<sub>CCB</sub> logic levels. This device has improved channel-to-channel skew, duty cycle distortion and symmetric rise or fall timing for applications requiring strict timing conditions.

This device is fully specified for partial-power-down applications using I<sub>off</sub>. The I<sub>off</sub> circuitry disables the outputs, thus preventing damaging current backflow through the device when it is powered down.

The V<sub>CC</sub> isolation feature is designed so that if either V<sub>CC</sub> supply is at or near 0V both ports will switch to a high-impedance state. This feature enables power isolation for communications across multiple MACs and PHYs, and is beneficial in situations where MACs and PHYs are powered up asynchronously preventing current backflow between devices.

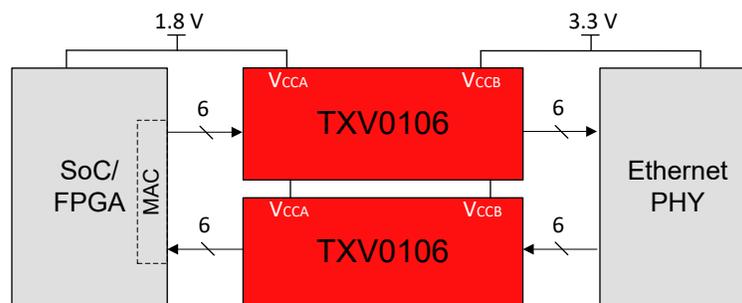

The TXV0106 transmits data in a fixed direction from the A bus to the B bus. When  $\overline{OE}$  is set to High, both Ax and Bx pins will be forced into a high-impedance state. See [Device Functional Modes](#) for a summary of the operation of the control logic.

### Package Information

PART NUMBER	PACKAGE <sup>(1)</sup>	PACKAGE SIZE <sup>(2)</sup>
TXV0106	BQB (WQFN, 16)	3.5 mm × 2.5 mm

(1) For more information see, [Section 11](#).

(2) The package size (length × width) is a nominal value and includes pins, where applicable.

## 4 Pin Configuration and Functions

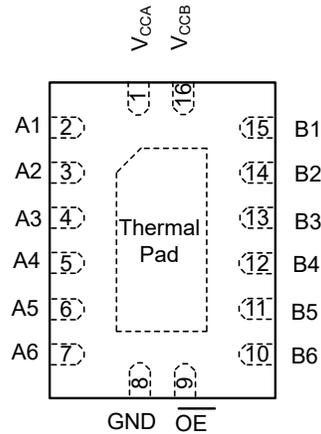

Figure 4-1. BQB Package, 16-Pin WQFN (Top View)

Table 4-1. Pin Functions

PIN		TYPE <sup>(1)</sup>	DESCRIPTION
NAME	NO.		
V <sub>CCA</sub>	1	—	A-port supply voltage. $1.2V \leq V_{CCA} \leq 3.6V$ .
A1	2	I/O	Input/output A1. Referenced to V <sub>CCA</sub> .
A2	3	I/O	Input/output A2. Referenced to V <sub>CCA</sub> .
A3	4	I/O	Input/output A3. Referenced to V <sub>CCA</sub> .
A4	5	I/O	Input/output A4. Referenced to V <sub>CCA</sub> .
A5	6	I/O	Input/output A5. Referenced to V <sub>CCA</sub> .
A6	7	I/O	Input/output A6. Referenced to V <sub>CCA</sub> .
GND	8	—	Ground.
OE	9	I	Output Enable. Pull to GND to enable all outputs. Pull to V <sub>CCA</sub> to place all outputs in high-impedance mode. Referenced to V <sub>CCA</sub> .
B6	10	I/O	Input/output B6. Referenced to V <sub>CCB</sub> .
B5	11	I/O	Input/output B5. Referenced to V <sub>CCB</sub> .
B4	12	I/O	Input/output B4. Referenced to V <sub>CCB</sub> .
B3	13	I/O	Input/output B3. Referenced to V <sub>CCB</sub> .
B2	14	I/O	Input/output B2. Referenced to V <sub>CCB</sub> .
B1	15	I/O	Input/output B1. Referenced to V <sub>CCB</sub> .
V <sub>CCB</sub>	16	—	B-port supply voltage. $1.2V \leq V_{CCB} \leq 3.6V$ .
Thermal pad		—	Thermal pad. Can be grounded (recommended) or left floating.

(1) I = input, O = output

## 5 Specifications

### 5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

			MIN	MAX	UNIT
V <sub>CCA</sub>	Supply voltage A		-0.5	4.6	V
V <sub>CCB</sub>	Supply voltage B		-0.5	4.6	V
V <sub>I</sub>	Input Voltage <sup>(2)</sup>	I/O Ports (A Port)	-0.5	4.6	V
		I/O Ports (B Port)	-0.5	4.6	
		Control Inputs	-0.5	4.6	
V <sub>O</sub>	Voltage applied to any output in the high-impedance or power-off state <sup>(2)</sup>	A Port	-0.5	4.6	V
		B Port	-0.5	4.6	
V <sub>O</sub>	Voltage applied to any output in the high or low state <sup>(2) (3)</sup>	A Port	-0.5	V <sub>CCA</sub> + 0.5	V
		B Port	-0.5	V <sub>CCB</sub> + 0.5	
I <sub>IK</sub>	Input clamp current	V <sub>I</sub> < 0	-50		mA
I <sub>OK</sub>	Output clamp current	V <sub>O</sub> < 0	-50		mA
I <sub>O</sub>	Continuous output current		-50	50	mA
	Continuous current through V <sub>CC</sub> or GND		-100	100	
T <sub>J</sub>	Junction Temperature			150	°C
T <sub>stg</sub>	Storage temperature		-65	150	°C

- (1) Operation outside the *Absolute Maximum Rating* may cause permanent device damage. *Absolute Maximum Rating* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Condition*. If used outside the *Recommended Operating Condition* but within the *Absolute Maximum Rating*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) The input voltage and output negative-voltage ratings may be exceeded if the input and output current ratings are observed.
- (3) The output positive-voltage rating may be exceeded up to 4.6 V maximum if the output current rating is observed.

### 5.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted) <sup>(1)</sup>

			MIN	MAX	UNIT
V <sub>CCA</sub>	Supply voltage A		1.14	3.6	V
V <sub>CCB</sub>	Supply voltage B		1.14	3.6	V
V <sub>IH</sub>	High-level input voltage	Data Inputs (Ax, Bx), OE (Referenced to V <sub>CCI</sub> )	V <sub>CCI</sub> = 1.14 V - 3.6 V	V <sub>CCI</sub> × 0.7	V
V <sub>IL</sub>	Low-level input voltage	Data Inputs (Ax, Bx), OE (Referenced to V <sub>CCI</sub> )	V <sub>CCI</sub> = 1.14 V - 3.6 V	V <sub>CCI</sub> × 0.3	V
I <sub>OH</sub>	High-level output current	V <sub>CCO</sub> = 1.14 V		-3	mA
		V <sub>CCO</sub> = 1.65 V - 1.95 V		-8	
		V <sub>CCO</sub> = 2.3 V - 2.7 V		-9	
		V <sub>CCO</sub> = 3 V - 3.6 V		-12	
I <sub>OL</sub>	Low-level output current	V <sub>CCO</sub> = 1.14 V		3	mA
		V <sub>CCO</sub> = 1.65 V - 1.95 V		8	
		V <sub>CCO</sub> = 2.3 V - 2.7 V		9	
		V <sub>CCO</sub> = 3 V - 3.6 V		12	
V <sub>I</sub>	Input voltage		0	3.6	V
V <sub>O</sub>	Output voltage	Active State	0	V <sub>CCO</sub>	V
		Tri-State	0	3.6	
Δt/Δv	Input transition rise and fall time			5	ns/V
T <sub>A</sub>	Operating free-air temperature		-40	125	°C

(1) V<sub>CCI</sub> is the V<sub>CC</sub> associated with the input port. V<sub>CCO</sub> is the V<sub>CC</sub> associated with the output port.

### 5.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TXV0106 / TXV0106-Q1	UNIT
		BQB (WQFN)	
		16 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	71.0	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	64.5	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	41.5	°C/W
Y <sub>JT</sub>	Junction-to-top characterization parameter	4.5	°C/W
Y <sub>JB</sub>	Junction-to-board characterization parameter	41.5	°C/W
R <sub>θJC(bottom)</sub>	Junction-to-case (bottom) thermal resistance	20.1	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) app report.

## 5.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)<sup>(1) (2)</sup>

PARAMETER		TEST CONDITIONS	V <sub>CCA</sub>	V <sub>CCB</sub>	Operating free-air temperature (T <sub>A</sub> )			UNIT	
					–40°C to 125°C				
					MIN	TYP	MAX		
V <sub>IL</sub>	Data Input_Negative threshold	Data inputs, $\overline{OE}$	1.14 V - 3.6 V	1.14 V - 3.6 V			0.3× V <sub>CCA</sub>	V	
V <sub>IH</sub>	Data Input_Positive threshold	Data inputs, $\overline{OE}$	1.14 V - 3.6 V	1.14 V - 3.6 V			0.7× V <sub>CCA</sub>	V	
V <sub>OH</sub>	High-level output voltage <sup>(3)</sup>	I <sub>OH</sub> = –3 mA	1.14 V	1.14 V			0.9	V	
		I <sub>OH</sub> = –8 mA	1.65 V	1.65 V			1.1		
		I <sub>OH</sub> = –9 mA	2.3 V	2.3 V			1.8		
		I <sub>OH</sub> = –12 mA	3 V	3 V			2.4		
V <sub>OL</sub>	Low-level output voltage <sup>(4)</sup>	I <sub>OL</sub> = 3 mA	1.14 V	1.14 V			0.1	V	
		I <sub>OL</sub> = 8 mA	1.65 V	1.65 V			0.27		
		I <sub>OL</sub> = 9 mA	2.3 V	2.3 V			0.23		
		I <sub>OL</sub> = 12 mA	3 V	3 V			0.26		
I <sub>I</sub>	Input leakage current	Data Inputs (Ax, Bx) V <sub>I</sub> = V <sub>CCI</sub> or GND	1.14 V - 3.6 V	1.14 V - 3.6 V			–1	1	μA
I <sub>off</sub>	Partial power down current	A Port or B Port V <sub>I</sub> or V <sub>O</sub> = 0 V - 3.6 V	0 V	0 V - 3.6 V			–5	3.6	μA
			0 V - 3.6 V	0 V			–5	3.6	
I <sub>OZ</sub>	Tri-state output current <sup>(5)</sup>	A or B Port: V <sub>I</sub> = V <sub>CCI</sub> or GND V <sub>O</sub> = V <sub>CCO</sub> or GND $\overline{OE}$ = V <sub>IH</sub>	3.6 V	3.6 V			–5	5	μA
I <sub>CCA</sub>	V <sub>CCA</sub> supply current	V <sub>I</sub> = V <sub>CCI</sub> or GND I <sub>O</sub> = 0	1.14 V - 3.6 V	1.14 V - 3.6 V				14	μA
			3.6 V	0 V				11	
			0 V	3.6 V			–1		
I <sub>CCB</sub>	V <sub>CCB</sub> supply current	V <sub>I</sub> = V <sub>CCI</sub> or GND I <sub>O</sub> = 0	1.14 V - 3.6 V	1.14 V - 3.6 V				14	μA
			3.6 V	0 V			–1		
			0 V	3.6 V				11	
I <sub>CCA</sub> + I <sub>CCB</sub>	Combined supply current	V <sub>I</sub> = V <sub>CCI</sub> or GND I <sub>O</sub> = 0	1.14 V - 3.6 V	1.14 V - 3.6 V				22	μA
C <sub>i</sub>	Control Input Capacitance	V <sub>I</sub> = 3.3 V or GND	3.3 V	3.3 V				3.9	pF
C <sub>io</sub>	Data I/O Capacitance	$\overline{OE}$ = V <sub>CCA</sub> , V <sub>O</sub> = 1.65V DC +1 MHz -16 dBm sine wave	3.3 V	3.3 V				2.7	pF

(1) V<sub>CCI</sub> is the V<sub>CC</sub> associated with the input port.

(2) V<sub>CCO</sub> is the V<sub>CC</sub> associated with the output port.

(3) Tested at V<sub>I</sub> = V<sub>IH</sub>.

(4) Tested at V<sub>I</sub> = V<sub>IL</sub>.

(5) For I/O ports, the parameter I<sub>OZ</sub> includes the input leakage current.

## 5.6 Switching Characteristics, $V_{CCA} = 1.2 \pm 0.06 \text{ V}$

Over the recommended temperature range at  $C_L = 5 \text{ pF}$ , unless otherwise indicated.

PARAMETER		FROM	TO	B-Port Supply Voltage ( $V_{CCB}$ )				UNIT
				1.2V ± 0.06	1.8 ± 0.15 V	2.5 ± 0.2 V	3.3 ± 0.3 V	
				TYP	TYP	TYP	TYP	
$t_{pd}$	Propagation delay	A	B	4.5	3.0	2.5	2.5	ns
$t_{dis}$	Disable time	$\overline{OE}$	B	7.5	6.5	6.0	6.0	ns
$t_{en}$	Enable time	$\overline{OE}$	B	9	7	6.5	6.5	ns
$T_R$	Rise time <sup>(1)</sup>	A	B	0.75	0.40	0.30	0.25	ns
$T_F$	Fall time <sup>(1)</sup>	A	B	0.65	0.40	0.30	0.30	ns
Duty Cycle	Duty cycle variation	A	B	50	50	50	50	%

(1) Rise and fall time is measured at 20% - 80%

## 5.7 Switching Characteristics, $V_{CCA} = 1.8 \pm 0.15 \text{ V}$

Minimum and maximum limits apply over the recommended temperature range at  $C_L = 15 \text{ pF}$  and 250 Mbps, unless otherwise indicated.

PARAMETER	FROM	TO	B-Port Supply Voltage ( $V_{CCB}$ )									UNIT	
			1.8 ± 0.15 V			2.5 ± 0.2 V			3.3 ± 0.3 V				
			MIN	TYP	MAX	MIN	TYP	MAX	MIN	TYP	MAX		
$t_{pd}$	Propagation delay	A	B	1.5	4.8	1.2	3.5	1.2	3.0	ns			
$t_{dis}$	Disable time	$\overline{OE}$	B	3.5	7.0	3.0	5.5	3.6	6.5	ns			
$t_{en}$	Enable time	$\overline{OE}$	B	1.2	4.0	1.0	3.0	1.0	2.6	ns			
$t_{SKO}$	Output channel-to-channel skew <sup>(1)</sup>	A	B	-450	450	-300	300	-330	330	ps			
$T_R$	Rise time <sup>(2)</sup>	A	B	0.49	1.35	0.40	0.95	0.35	0.80	ns			
$T_F$	Fall time <sup>(2)</sup>	A	B	0.45	1.35	0.35	0.95	0.35	0.80	ns			
Duty Cycle	Duty cycle variation	A	B	47	50	56	47	50	54	47	50	54	%

## 6 Parameter Measurement Information

### 6.1 Load Circuit and Voltage Waveforms

Unless otherwise noted, all input pulses are supplied by generators having the following characteristics:

- $f = 1\text{MHz}$
- $Z_O = 50\Omega$
- $\Delta t/\Delta V \leq 1\text{ns/V}$

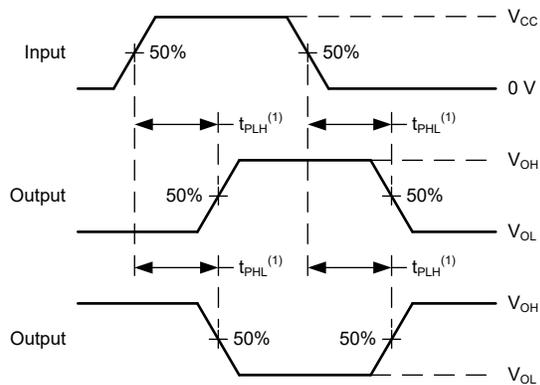

A.  $C_L$  includes probe and jig capacitance.

**Figure 6-1. Load Circuit**

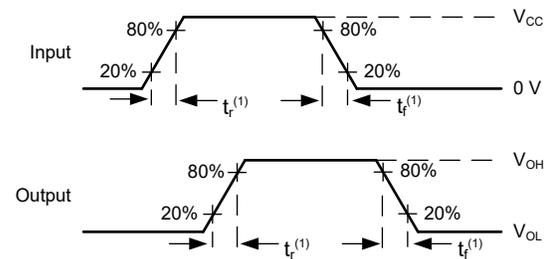

**Table 6-1. Load Circuit Conditions**

Parameter	$V_{CCO}$	$R_L$	$C_L$	$S_1$	$V_{TP}$
$t_{pd}$ Propagation (delay) time	1.14V – 3.6V	2k $\Omega$	15pF	Open	N/A
$t_{en}$ , $t_{dis}$ Enable time, disable time	1.14V – 3.6V	2k $\Omega$	15pF	$2 \times V_{CCO}$	0.15V
$t_{en}$ , $t_{dis}$ Enable time, disable time	1.14V – 3.6V	2k $\Omega$	15pF	GND	0.15V

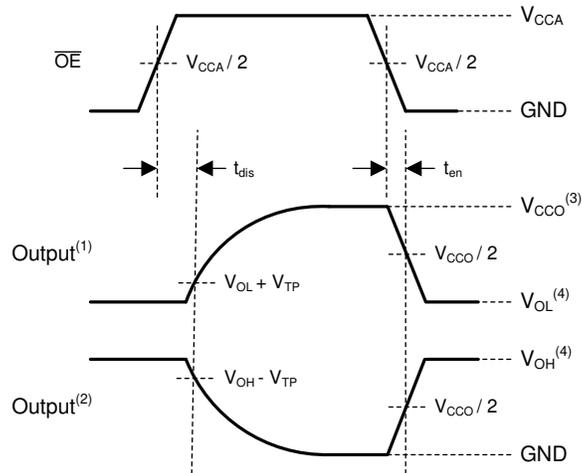

1. The greater between  $t_{PLH}$  and  $t_{PHL}$  is the same as  $t_{pd}$ .
2.  $V_{OH}$  and  $V_{OL}$  are typical output voltage levels that occur with specified  $R_L$ ,  $C_L$ , and  $S_1$

**Figure 6-2. Propagation Delay**

1.  $V_{OH}$  and  $V_{OL}$  are typical output voltage levels that occur with specified  $R_L$ ,  $C_L$ , and  $S_1$

**Figure 6-3. Input Transition Rise and Fall Rate**

- Output waveform on the condition that input is driven to a valid Logic Low.
- Output waveform on the condition that input is driven to a valid Logic High.
- $V_{CCO}$  is the supply pin associated with the output port.
- $V_{OH}$  and  $V_{OL}$  are typical output voltage levels with specified  $R_L$ ,  $C_L$ , and  $S_1$ .

**Figure 6-4. Enable Time and Disable Time**

## 7 Detailed Description

### 7.1 Overview

The TXV0106 is an 6-bit translating transceiver that uses two individually configurable power-supply rails. The device is operational with both  $V_{CCA}$  and  $V_{CCB}$  supplies as low as 1.14V and as high as 3.6V. Additionally, the device can be used as a buffer with  $V_{CCA} = V_{CCB}$ . The Ax port is designed to track  $V_{CCA}$ , and the Bx port is designed to track  $V_{CCB}$ .

The TXV0106 device is designed for asynchronous communication between data buses, and transmits data in a fixed direction from the A bus to the B bus. The output-enable input ( $\overline{OE}$ ) is used to disable the outputs so the buses are effectively isolated. The output-enable pin ( $\overline{OE}$ ) of the TXV0106 is referenced to  $V_{CCA}$ . To enable the high-impedance state of the level shifter I/Os during power up or power down, the  $\overline{OE}$  pin should be tied to  $V_{CCA}$  through a pullup resistor.

This device is fully specified for partial-power-down applications using the  $I_{off}$  current. The  $I_{off}$  protection circuitry prevents excessive current from being drawn from or sourced into an input, output, or I/O while the device is powered down.

### 7.2 Functional Block Diagram

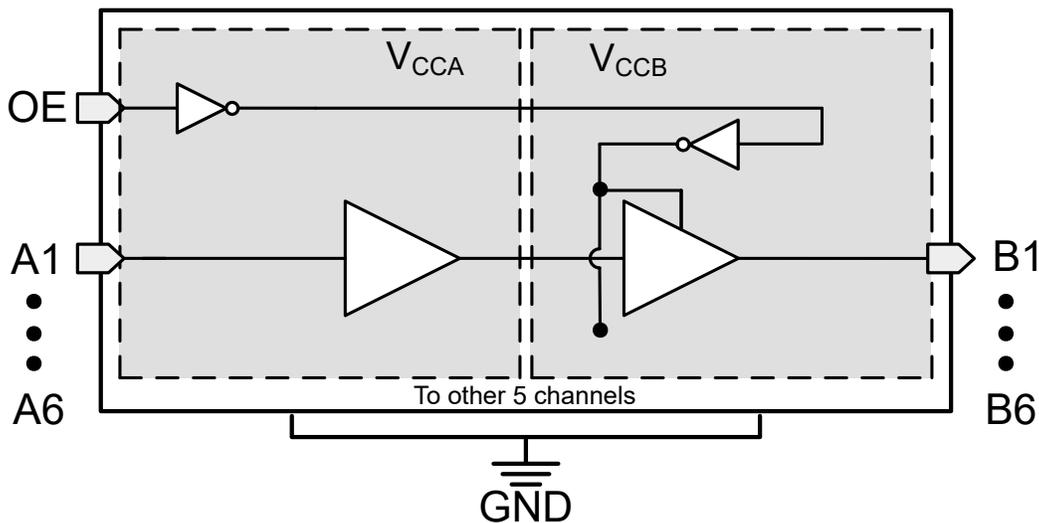

Figure 7-1. Functional Block Diagram of the TXV0106

## 7.3 Feature Description

### 7.3.1 Balanced High-Drive CMOS Push-Pull Outputs

A balanced output allows the device to sink and source similar currents. The high drive capability of this device creates fast edges into light loads so routing and load conditions should be considered to prevent ringing. Additionally, the outputs of this device are capable of driving larger currents than the device can sustain without being damaged. The electrical and thermal limits defined in the [Absolute Maximum Ratings](#) must be followed at all times.

### 7.3.2 Partial Power Down ( $I_{off}$ )

The inputs and outputs for this device enter a high-impedance state when the device is powered down, inhibiting current backflow into the device. The maximum leakage into or out of any input or output pin on the device is specified by  $I_{off}$  in the [Electrical Characteristics](#).

### 7.3.3 $V_{CC}$ Isolation and $V_{CC}$ Disconnect ( $I_{off(float)}$ )

This device has 2 features ( $V_{CC}$  Isolation and  $V_{CC}$  Disconnect) which helps in preventing current backflow in case the device is powered down unexpectedly.  $V_{CC}$  Isolation: when one of the supplies is kept at (or goes to) zero during normal operation, no current will be consumed by the supply that is maintained. This scenario forces all I/Os to be High-Z.  $V_{CC}$  Disconnect: when one of the supplies is left floating (disconnect) after ramping up, the I/Os are forced into High-Z without consuming any current from the maintained supply. In both cases, the I/Os will enter a high-impedance state when either supply ( $V_{CCA}$  or  $V_{CCB}$ ) is  $<100$  mV or left floating, while the other supply is still connected to the device. The following figure shows more information.

The maximum supply current is specified by  $I_{CCx}$ , while  $V_{CCx}$  is floating, in the [Electrical Characteristics](#). The maximum leakage into or out of any input or output pin on the device is specified by  $I_{off(float)}$  in the [Electrical Characteristics](#).

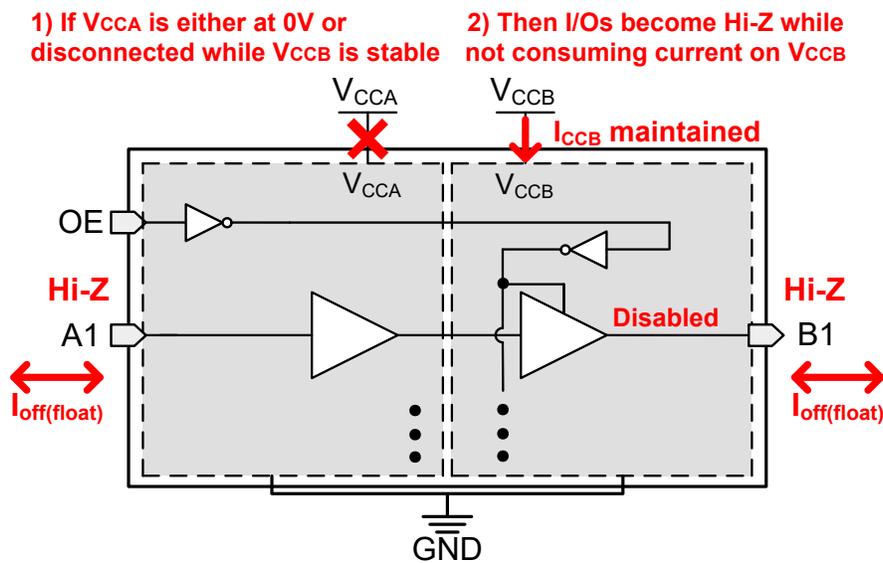

Figure 7-2.  $V_{CC}$  Disconnect and  $V_{CC}$  Isolation Feature

### 7.3.4 Over-Voltage Tolerant Inputs

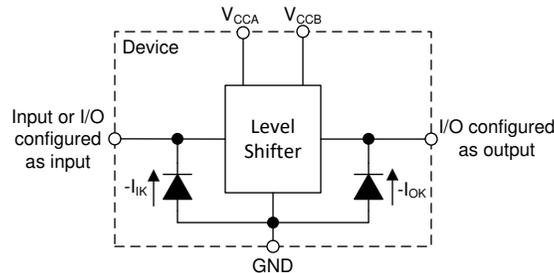

Input signals to this device can be driven above the supply voltage so long as they remain below the maximum input voltage value specified in the [Recommended Operating Conditions](#).

### 7.3.5 Negative Clamping Diodes

The inputs and outputs to this device have negative clamping diodes as depicted in [Figure 7-3](#)

**CAUTION**

Voltages beyond the values specified in the [Absolute Maximum Ratings](#) table can cause damage to the device. The input negative-voltage and output voltage ratings may be exceeded if the input and output clamp-current ratings are observed.

**Figure 7-3. Electrical Placement of Clamping Diodes for Each Input and Output**

**7.3.6 Fully Configurable Dual-Rail Design**

Both the  $V_{CCA}$  and  $V_{CCB}$  pins can be supplied at any voltage from 1.14V to 3.6V, making the device an excellent choice for translating between any of the voltage nodes (1.2V, 1.8V, 2.5V, and 3.3V).

**7.3.7 Supports High-Speed Translation**

The TXV0106 device can support high data rate applications. The translated signal data rate can support up to 500Mbps when the signal is translated from 1.65V to 3.6V. For the device to meet RGMII 2.0 timing specifications (rise or fall time, skew, and duty cycle distortion) the data rate will need to be lowered to 250Mbps.

**7.3.8 Integrated Damping Resistor and Impedance Matching**

The TXV0106 features a 10  $\Omega$  integrated damping resistor to help minimize signal reflections on the rising and falling edges. If impedance matching with a 50  $\Omega$  load is required, then a series resistor will be needed. Since the output impedance of the device will vary with the output voltage ( $V_{CCB}$ ), [Table 8-1](#) provides the recommended resistor values needed to impedance match a 50  $\Omega$  load

**Table 7-1. Series Resistor Values for 50  $\Omega$  Impedance Matching**

Output Voltage ( $V_{CCB}$ )	1.2 V	1.8 V	2.5 V	3.3 V
Series Resistor	53 $\Omega$	25 $\Omega$	30 $\Omega$	32 $\Omega$

**7.4 Device Functional Modes**

**Table 7-2. Function Table**

CONTROL INPUTS (1)	PORT STATUS		OPERATION
	A PORT	B PORT	
$\overline{OE}$			
L	Input (Hi-Z)	Output (Enabled)	A data to B bus
H	Input (Hi-Z)	Input (Hi-Z)	Isolation

(1) Input circuits of the data I/Os are always active and should be kept at a valid logic level.

## 8 Application and Implementation

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 8.1 Application Information

The TXV0106 device can be used in level-translation applications for interfacing devices or systems operating at different interface voltages with one another. The TXV0106 device is an excellent choice for use in applications where a push-pull driver is connected to the data I/Os. The maximum data rate can be up to 500Mbps when device translates a signal from 1.65V to 3.6V.

### 8.2 Typical Application

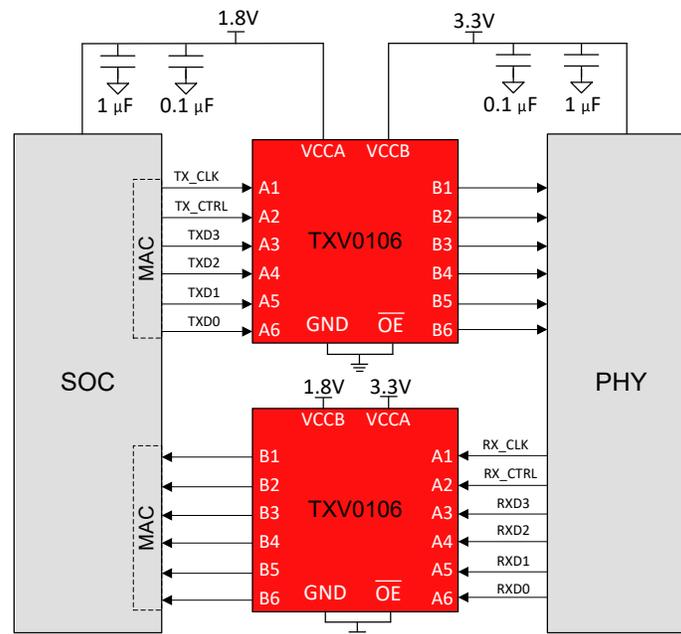

Figure 8-1. RGMII Application (Interfacing between MAC and PHY)

#### 8.2.1 Design Requirements

For this design example, use the parameters listed in [Table 8-1](#).

Table 8-1. Design Parameters

DESIGN PARAMETERS	EXAMPLE VALUES
Input voltage range	1.65V to 3.6V
Output voltage range	1.65V to 3.6V
Frequency	125MHz
Load Capacitance	5pF
Input Transition Rise/Fall Time	< 2ns/V

## 8.2.2 Detailed Design Procedure

To begin the design process, determine the following:

- Input voltage range:
  - Use the supply voltage of the device that is driving the TXV0106 device to determine the input voltage range. For a valid logic-high, the value must exceed the positive-going input-threshold voltage ( $V_{t+}$ ) of the input port. For a valid logic low the value must be less than the negative-going input-threshold voltage ( $V_{t-}$ ) of the input port.
- Output voltage range:
  - Use the supply voltage of the device that the TXV0106 device is driving to determine the output voltage range.
- RGMII timing:
  - For the TXV0106 to meet RGMII timing specifications, parameters like frequency,  $C_{LOAD}$  and input rise/fall transition have to be met. Ensure each channel does not exceed a maximum frequency of 125MHz, use a  $C_{LOAD}$  no greater than 5pF, and use an input rise or fall transition no greater than 2ns/V.

## 8.2.3 Application Curves

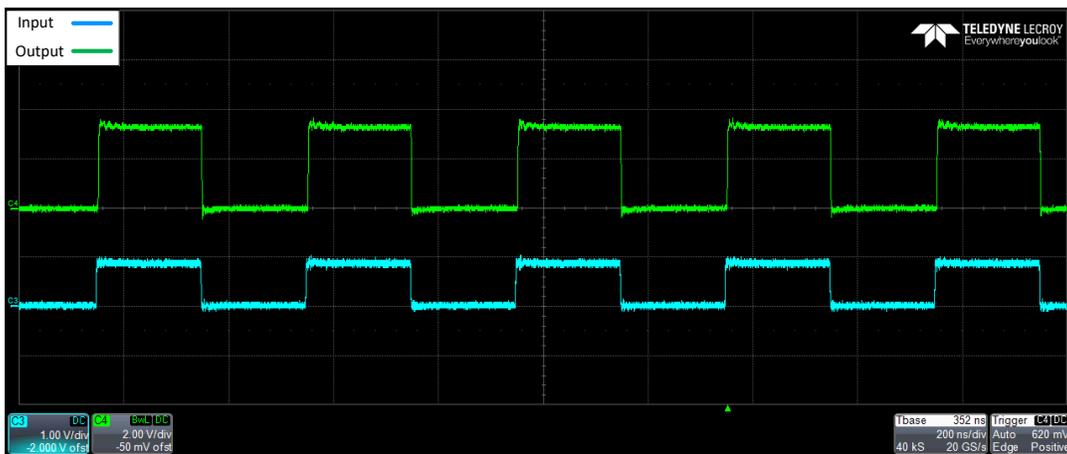

Figure 8-2. Up Translation (1.8V to 3.3V)  $C_{LOAD} = 15pF$  at 2.5MHz

## 8.3 System Examples

### 8.3.1 Solving Power Sequencing Challenges with the TXV0106

The TXV0106 not only solves voltage mismatch between interfaces but also solves power sequencing challenges. In some Ethernet applications, you may have a multi-core RGMII system with an Ethernet switch [Figure 8-3](#). In other applications, you may have a standard Ethernet interface with one MAC and PHY. In either case, it is necessary to power up each device properly. This will prevent the I/O pins from powering up before the core blocks, which can cause in-rush current during power up or bus contention and other malfunctions.

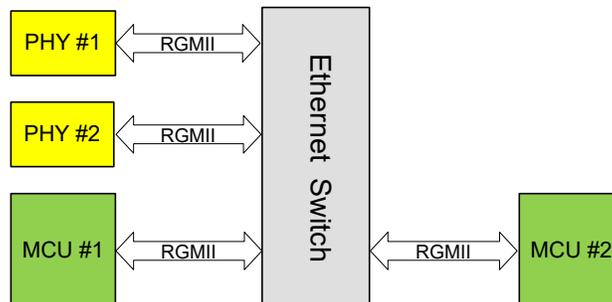

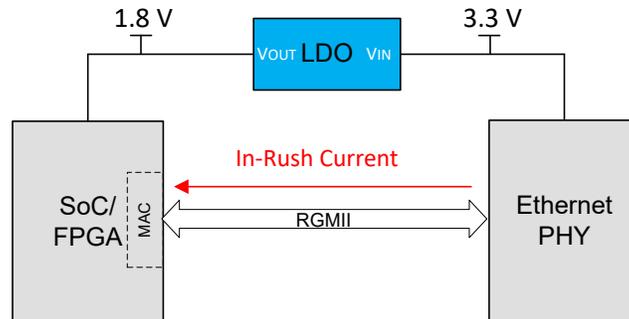

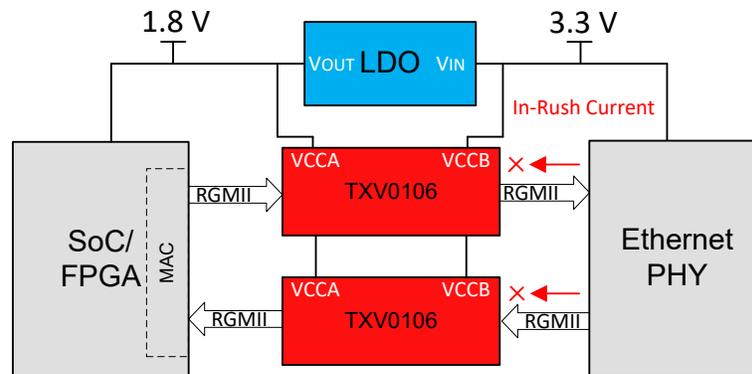

Figure 8-3. Multi-Core RGMII Communication

Low Dropout (LDO) devices are a common way to power up devices, but they do not provide any power sequencing features. As can be seen in [Figure 8-4](#), before the 1.8V can be applied to the MAC, the input of the LDO will need to come up first. This will result in the PHY powering up which can lead to in-rush current flowing into the MAC I/O pins.

**Figure 8-4. Residual Current Flowing Into MAC I/O Pins After PHY is Powered Up**

With the TXV0106 supporting the  $I_{off-float}$  feature, in-rush current from improper power sequencing can be prevented. When either power supply pin is at 0V or below 100mV, the I/O pins become high impedance until both pins go above 100mV. The high impedance state will prevent any in-rush current from flowing to the opposite side.

**Figure 8-5. Using the TXV0106 for Power Isolation**

For additional information on the TXV0106 and power isolation use cases, see the [Solving Power Sequencing Challenges for Ethernet RGMII Communications](#) application note.

## 8.4 Power Supply Recommendations

The TXV0106 uses two separate configurable power supply rails,  $V_{CCA}$  and  $V_{CCB}$ . The A port and B port are designed to track  $V_{CCA}$  and  $V_{CCB}$ , respectively, allowing for low-voltage fixed translation between any of the 1.2V, 1.8V, 2.5V and 3.3V voltage nodes.

The output-enable  $\overline{OE}$  input circuit is designed to be supplied by  $V_{CCA}$ . When the  $\overline{OE}$  input is high, all outputs are placed in the high-impedance state. To put the outputs in a high-impedance state during power up or power down, tie the  $\overline{OE}$  input pin to  $V_{CCA}$  through a pullup resistor and do not enable it until  $V_{CCA}$  and  $V_{CCB}$  are fully ramped and stable. The current-sinking capability of the driver determines the minimum value of the pullup resistor to  $V_{CCA}$ .

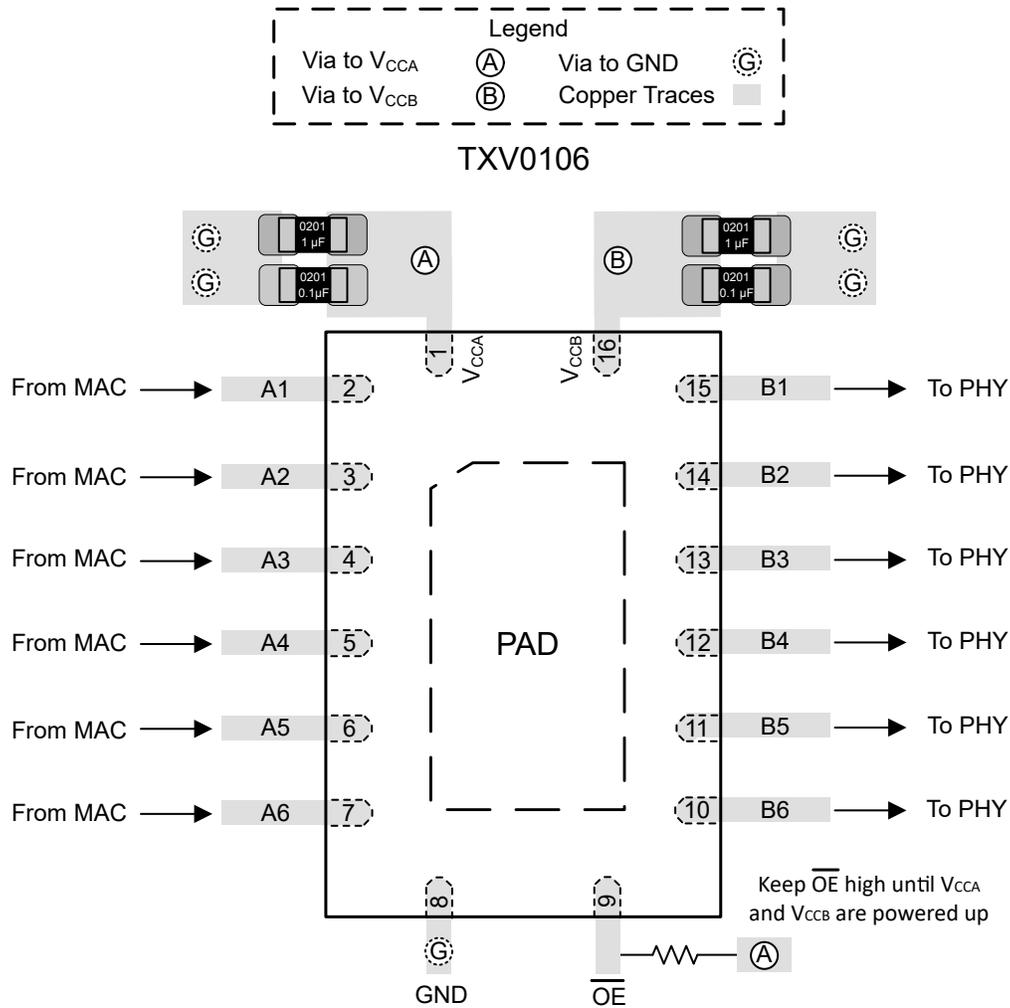

## 8.5 Layout

### 8.5.1 Layout Guidelines

For device reliability, it is recommended to follow common printed-circuit board layout guidelines such as:

- Use short trace lengths to avoid excessive loading.
- Use bypass capacitors on the power supply pins and place them as close to the device as possible.
- A 0.1 $\mu$ F bypass capacitor is recommended, but transient performance can be improved by having both 1 $\mu$ F and 0.1 $\mu$ F capacitors in parallel with the smallest value capacitor placed closest to the power pin.
- The high drive capability of this device creates fast edges into light loads. Routing and load conditions should be considered to prevent ringing.

### 8.5.2 Layout Example

### 9.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](#). Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 9.3 Support Resources

TI E2E™ [support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

### 9.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.

All trademarks are the property of their respective owners.

### 9.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## 10 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision * (December 2023) to Revision A (April 2024)	Page
• Changed the status of the data sheet from: <i>Advanced Information</i> to: <i>Production Data</i> .....	1
• Added 1.14V Test Conditions to <i>Recommended Operating Conditions</i> Table.....	5
• Added 1.14V Test Conditions to <i>Electrical Characteristics</i> Table.....	6
• Added 1.2V Switching Characteristics Table.....	7

## 11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TXV0106BQBR	ACTIVE	WQFN	BQB	16	3000	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 125	TV106	Samples

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
